## NOAA Fisheries Publications

Each year NOAA Fisheries produces three annual reports covering different aspects of the status of United States marine fisheries.

Status of Stocks is an annual report to Congress on the status of U.S. fisheries and is required by the Magnu-son-Stevens Fishery Conservation and Management Act. This report, which is published each spring, summarizes the number of stocks on the overfished, overfishing and rebuilt lists for U.S. federally managed fish stocks and stock complexes. The report also shows trends over time, discusses the value and contributions of our partners, and highlights how management actions taken by NOAA Fisheries have improved the status of U.S. federally managed stocks. For example, the 2014 report shows that the number of stocks listed as subject to overfishing or overfished is at an all-time low. http://www.nmfs.noaa.gov/sfa/fisheries_eco/status_of_fisheries/

Fisheries of the United States, published each fall, has been produced in its various forms for more than 100 years. It is the NOAA Fisheries yearbook of fishery statistics for the United States. It provides a snapshot of data, primarily at the national level, on U.S. recreational catch and commercial fisheries landings and value. In addition, data are reported on U.S. aquaculture production, the U.S. fishery processing industry, imports and exports of fishery-related products, and domestic supply and per capita consumption of fishery products. The focus is not on economic analysis, although value of landings, processed products and foreign trade are included.
http://www.st.nmfs.noaa.gov/commercial-fisheries/fus/fus16/index

Fisheries Economics of the United States, published each fall, provides a detailed look at the economic performance of commercial and recreational fisheries and other marine-related sectors on a state, regional and national basis. The economic impact of commercial and recreational fishing activities in the U.S. is also reported in terms of employment, sales and value-added impacts. The report provides management highlights for each region that include a summary of stock status, updates on catch share programs, and other selected management issues. Economic performance indicators for catch share programs are reported and will be extended to include non-catch share fisheries in the next edition. http://www.st.nmfs.noaa.gov/economics/publications/feus/fisheries_economics_2015/index

## Preface

## Fisheries Economics of the United States, 2015

Fisheries Economics of the United States, 2015, is the ninth volume in this annual series, which is intended to provide the public with easily accessible economic information about the nation's commercial and recreational fishing activities and fishing-related industries. This year's report covers the years 2006 to 2015 and provides descriptive statistics for the following categories: economic impacts of the commercial fishing and seafood industry; commercial fisheries landings, revenue and price trends; saltwater angler expenditures and economic impacts of marine recreational fishing; recreational fishing catch, effort and participation rates; and employer and non-employer establishment, payroll, employees and annual receipt information for fishingrelated industries.

The report also provides management highlights for each region that include a summary of stock status, updates on catch share programs, and other selected management issues. Economic performance indicators for catch share programs are reported.

## Sources of Data

Information in this report came from many sources. Commercial landings, revenue, and price data, and recreational fishing effort and participation data, were primarily obtained from the Fisheries Statistics Division, Office of Science and Technology, and NOAA Fisheries. Other data sources included the Alaska Fisheries Science Center, NOAA Fisheries; Alaska Department of Fish and Game; California Department of Fish and Game; Oregon Department of Fish and Wildlife; Washington Department of Fish and Wildlife; the Pacific Coast Fisheries Information Network (PacFIN); Texas Parks and Wildlife Department; and Western Pacific Fisheries Information Network (WPacFIN). Economic impacts from the commercial fishing and seafood industry and recreational fishing sectors are from two separate national IMPLAN models of the Economics and Sociocultural Analysis Division, Office of Science and Technology, NOAA Fisheries. Fishing-related industry information was obtained from the U.S. Census Bureau, Bureau of Economic Analysis, and Bureau of Labor Statistics.

## Acknowledgments

Many people participated in the production of this report. Cameron Speir, Cara Mayo, and Gabrielle Ryan are the editors of this report series; Rita Curtis, Sabrina Lovell, and Cara Mayo were primary authors and analysts on this edition of Fisheries Economics of the United States. Key collaborators include Megan Strachura, Lauren Dolinger Few, Karen Greene, Laura Johansen, Jean Lee, Michael Lewis, Michael Liddel, Alan Lowther, and Eric Thunberg. The report's design and layout was done by Avi Litwack, Jacqui Fenner, and Cara Mayo.

NOAA Fisheries staff in the regional Fisheries Science Centers and Regional Offices provided expertise: Alan Haynie, Justin Hospital, Christopher Liese, Michael Travis and Stephen Holiman. Other colleagues who provided information and expertise included Mark Fisher (Texas Parks and Wildlife Department), Ed Hibsch (Pacific States Marine Fisheries Commission), and Williams Romberg (Alaska Department of Fish and Game).

## Commercial Fisheries - what does the term mean?

Commercial fisheries, in this report, refers to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fishermen. It also excludes the for-hire sector, which earns its revenue from selling recreational fishing trips to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and ex-vessel prices of key species and species groups.

## METRICS DEFINITIONS ${ }^{1}$

## Economic Impacts

The employment, personal income, and output generated by the commercial harvest sector and other major components of the U.S. seafood industry.

## Landings

The poundage or number of fish unloaded by commercial fishermen or brought to shore.

## Landings Revenue

The price that fishermen are paid for their catch.

## Ex-vessel Prices

The price received by a captain, at the point of landing, for the catch.

## FREQUENTLY ASKED QUESTIONS

## What are fish caught with in commercial fishing?

Fish can be caught using a variety of gear, including potts and traps, trawls and seines, gillnets, dredges, and hooks and lines.

## What happens to seafood caught by commercial fishermen?

Fish caught by commercial fishermen are first processed and packaged. Then they are sold to various establishments for consumption, such as restaurants and supermarkets. They can also be used as animal food and for medical purposes (such as fish oil pills).

## Does the United States get seafood from anywhere else?

Not all fish are caught by U.S. commercial fishermen. A large percent of the seafood the U.S. receives is imported.

[^0]
## Recreational Fisheries - what does the term mean?

Recreational fisheries, or recreational fishing, refer to fishing for pleasure rather than selling the fish for profit (i.e., commercial fishing) or for subsistence. The recreational fisheries section of Fisheries Economics of the U.S. reports on angler trips, participation, expenditures and economic impacts, and catch of key species and species groups. Only saltwater, or marine, recreational fishing is included in FEUS.

## METRICS DEFINITIONS ${ }^{1}$

## Economic Impacts and Expenditures

The employment, sales, and personal income generated by expenditures on fishing trips and fishing-related durable goods (i.e. equipment used for recreational fishing).

## Participation

The number of anglers who fish in a given state or region. Anglers can be from in-state or out-of-state and from a coastal county or non-coastal county.

## Fishing Trips/ Effort

The number of fishing trips taken by recreational fishermen (anglers).

## Harvest and Release

The total number or fish either: 1) caught and kept (harvested), or 2) caught and released, by recreational anglers from an area over a period of time. Total catch is the sum of the number of fish harvested and released.

## FREQUENTLY ASKED QUESTIONS

How do anglers affect the fishing economy?
When anglers participate in fishing activities, they support sales and employment in recreational fishing and other types of businesses. Anglers buy fishing equipment from bait and tackle shops, rent or buy boats, or pay to have others take them on charter boats to fish. They may also pay for food and drink at local restaurants, purchase gas for their boat, and stay in hotels for overnight fishing trips.

## What do anglers spend their money on?

Durable goods, such as fishing tackle and boat, vehicle, and second home expenses. Trips, which can be taken in one of three modes: as forhire (charter or party boat), private (or rental boat), and shore (fishing from shore). Some examples of trip expenditures include fuel, bait, ice, and charter or guide fees.

## What do anglers do with their catch?

Some anglers catch fish to eat (i.e., harvest), while others practice catch and release. In recreational fishing, anglers do not sell the fish they catch for profit.

## Marine Economy - what does the term mean?

The "Marine Economy," in this report, refers to the economic activity generated by sectors of the economy that depend directly on oceans (or Great Lakes). We report on two industry sectors within the marine economy: 1) seafood sales and processing; and 2) transport, support, and marine operations. Information such as the number of establishments, number of employees, and annual payroll for these fishing and marine-related industries is used to determine their relative levels of economic activity in a state.

## METRICS DEFINITIONS ${ }^{1}$

## Seafood Sales and Processing

These sectors are a direct representation of the Establishments, Employees, Sales and Payroll for seafood processors, wholesalers, and retailers that buy fish from commercial fishermen and distribute to consumers.

## Transport, Support, and Marine Operations

The various sectors that contribute to the overall marine economy that may or may not support the fishing economy.

## FREQUENTLY ASKED QUESTIONS

## Does the marine economy include commercial and recreational

 fisheries?Yes, commercial and recreational fisheries contribute to the overall marine economy.

## What marine economy sectors, featured in the report, are related to commercial and recreational fisheries?

The seafood product preparation \& packaging and wholesale and retail seafood sales sectors are major parts of the commercial fishing industry. The Marinas, Navigational Services, Port \& Harbor operations, and Ship \& Boat Building sectors provide goods and services used in both commercial and recreational fisheries.

## Why does the report include sectors that are independent of the fishing economy?

Information on sectors that are independent of the fishing economy, like freight transportation, provides context for how national and regional economies are affected by the use of ocean resources.

## National Overview

## MANAGEMENT CONTEXT

The authority to manage federal fisheries in the United States was granted to the Secretary of Commerce by the Magnuson-Stevens Fishery Conservation and Management Act (P.L. 94-265 as amended by P.L. 109-479). NOAA Fisheries is the federal agency with delegated authority from the Secretary of Commerce to oversee fishing activities in federal waters. Federal fisheries are generally defined as fishing activities that take place in the U.S. Exclusive Economic Zone (EEZ, between 3 and 200 nautical miles from the coastline). Generally, individual states retain management authority over fishing activities within three nautical miles of their coasts.

## Regional Fishery Management Councils

- North Pacific
- Mid-Atlantic
- Pacific
- South Atlantic
- Western Pacific
- Gulf of Mexico
- New England
- Caribbean

Nationwide, 46 fishery management plans (FMPs) provide a framework for managing the harvest of 473 fish stocks and stock complexes. ${ }^{1}$ These fishery management plans are developed by Regional Fishery Management Councils (FMCs) in eight regions nationwide: North Pacific, Pacific, Western Pacific, New England, Mid-Atlantic, South Atlantic, Gulf of Mexico and Caribbean Regions. After an FMP is developed, it must be approved by the Secretary of Commerce in consultation with NOAA Fisheries before it is implemented. Enough information exists to determine the overfishing status for 313 of the 473 stocks and stock complexes (66\%): 28 are subject to overfishing (9\% of stocks with known status). The overfished status of 233 stocks (49\%) is known: 38 stocks ( $16 \%$ of stocks with known status) are categorized as overfished. ${ }^{2}$

## Transboundary and International Fisheries

 NOAA Fisheries is also actively involved in negotiating conservation and management measures including total allowable catch levels, fishery allocations, and monitoring and control schemes for internationally shared fisheries resources. Shared fisheries resources include those in areas where the EEZ of the U.S. overlaps with other nations(transboundary areas), and in areas beyond the U.S. EEZ, i.e., international waters or the high seas. The Gulf of Alaska and the Gulf of Maine are examples of these transboundary areas. An area in the Bering Sea outside the EEZs of Canada, Japan, and Russia, called the Donut Hole, is an example of international waters. Loss of sea ice will create new transboundary areas and international waters in the Arctic. Regional Fishery Management Organizations (RFMOs) are multinational organizations with interests in internationally shared fish stocks and associated fishing activities. Primary objectives of these RFMOs are to research, assess and adopt measures for the conservation and coordinated management of target species, such as bigeye tuna. Some RFMOs also collect data and evaluate and adopt measures for the conservation and scientific assessment of non-target species, also known as bycatch. Non-target species include seabirds, marine mammals, sea turtles and fish species caught incidentally to target species. The commitment to conserving and protecting all species associated with, or affected by, fishing activities is outlined in the Food and Agriculture Organization's (FAO's) Code of Conduct for Responsible Fisheries established in 1995. Another issue of particular concern for NOAA Fisheries is illegal, unreported and unregulated (IUU) fishing activities. IUU fishing generally refers to fishing that violates national laws or internationally agreed conservation and management measures in effect in oceans around the world. IUU fishing can include fishing without a license or quota for certain species, unauthorized trans-shipments to cargo vessels, failing to report catches or making false reports, keeping undersized fish or fish that are otherwise protected by regulations, fishing in closed areas or during closed seasons, and using prohibited fishing gear. Experts estimate that global economic losses from IUU fishing range from $\$ 10$ billion to $\$ 23.5$ billion annually, representing between 11 and 26 million tons of fish. ${ }^{3}$

NOAA Fisheries is actively collaborating with other federal agencies as part of the National Ocean Council Committee on IUU Fishing and Seafood Fraud. This network of agencies work together to implement measures outlined in an action plan developed by the Presidential Task Force on Combatting IUU Fishing and Seafood Fraud. The plan includes actions that will strengthen enforcement; create and expand partnerships with state and local

[^1]governments, industry, and non-governmental organizations; and create a risk-based traceability program to track seafood from harvest to entry into U.S. commerce. The plan also highlights ways in which the United States will work with our foreign partners to strengthen international governance, enhance cooperation, and build capacity to combat IUU fishing and seafood fraud.

## Regional Fishery Management Organizations

NOAA Fisheries participates in eight RFMOs globally.
Each RMFO is listed by ocean basin below. ${ }^{4}$

## Pacific

- Pacific Salmon Commission
- International Pacific Halibut Commission
- Inter-American Tropical Tuna Commission
- Western and Central Pacific Fishery Commission

## Atlantic

- International Commission for the Conservation of Atlantic Tunas
- North Atlantic Salmon Conservation Organization
- Northwest Atlantic Fisheries Organization

## Antarctic

- Commission for the Conservation of Antarctic Marine Living Resources

## Saltwater Recreational Fisheries Policy

In February 2015, NOAA Fisheries established a formal National Saltwater Recreational Fisheries Policy to broadly guide future actions and better integrate recreational fishing with NOAA Fisheries' mission. The Policy focuses on six guiding principles: 1) support ecosystem conservation and enhancement; 2) promote public access to quality recreational fishing opportunities; 3) coordinate with state and federal management entities; 4) advance innovative solutions to evolving science, management and environmental challenges; 5) provide scientifically sound and trusted social, cultural, economic and ecological information; and 6) communicate and engage with the recreational fishing public.

## Threatened and Endangered Species

NOAA Fisheries is also the lead agency for the conservation and protection of marine and anadromous species that fall within the purview of the Endangered Species

Act (ESA). Currently, there are 143 threatened and endangered marine species under the ESA (see Table 1).

Table 1. Endangered and Threatened Species under NOAA Fisheries Jurisdiction ${ }^{5}$

| Species Group | Number of Species |
| :--- | ---: |
| Marine and Anadromous Fish | 66 |
| Marine Mammals | 31 |
| Sea Turtles | 26 |
| Marine Invertebrates | 27 |
| Plants | 1 |
| Total Threatened and | 151 |
| Endangered Marine Species |  |

In addition to threatened and endangered marine and anadromous species, NOAA Fisheries also helps identify candidate and proposed species. Candidate species are actively being considered for listing as endangered or threatened under the ESA. These species also include those for which NOAA Fisheries has initiated a status review that it has announced in the Federal Register. Proposed species are candidate species that were found to warrant listing as either threatened or endangered. These species were officially proposed as such in a Federal Register notice after the completion of a status review and consideration of other protective measures. Currently, 13 candidate species and 12 proposed species are under consideration for listing.

NOAA Fisheries is also responsible for protecting marine mammals under the Marine Mammal Protection Act. ${ }^{6}$ Enacting this act in 1972, Congress recognized that marine mammal species or stocks may be in danger of extinction or depletion as a result of human activities; marine mammal species or stocks should not be allowed to fall below their optimum sustainable population levels; measures should be taken to replenish marine mammal species or stocks; there is inadequate knowledge of the marine mammal ecology and population dynamics; and marine mammals have proven to be resources of great international significance. NOAA Fisheries engages in activities such as preventing the harassment, capture, or killing of marine mammals; preparing marine mammal stock assessments; and studying interactions between marine mammals and fisheries.

[^2]
## Essential Fish Habitats

Sustainable commercial and recreational fisheries depend on healthy habitats. These habitats include rivers, estuaries and the open ocean where marine and anadromous species feed, grow and reproduce. Consideration of these habitat areas is part of an ecosystem-based management approach for managing fisheries in a more sustainable and holistic manner. Since 1996, federal fishery management plans are required to identify and describe essential fish habitat (EFH) for all federally managed species. Habitat areas that are necessary for a fish species' growth, reproduction and development are considered EFH. To the extent practicable, NOAA Fisheries and the FMCs must minimize adverse effects to EFH caused by fishing.

Though not required, habitat areas of particular concern (HAPC) can be identified to help focus EFH conservation efforts. The HAPC designation alone does not confer additional protection or restrictions to an area, but helps to focus EFH conservation, management and research priorities. HAPC designation is a valuable way to acknowledge areas where detailed information exists on ecological function and habitat vulnerability, indicating a greater need for conservation and management. To date, approximately 100 HAPCs have been designated including specific coral, seamount and spawning areas. A recent effort undertaken by NOAA Fisheries was the creation of a Habitat Assessment Improvement Plan. ${ }^{7}$ The goal of this plan is to advance NOAA Fisheries' ability to identify EFH and HAPCs and provide the information needed to assess impacts to EFH.

## Catch Share Programs

Market-based management tools are used by fishery managers to reduce over-capitalization, increase the economic viability of fisheries, and promote individual accountability for harvest and harvesting practices. A variety of market-based tools are available to fishery managers, including catch share programs. Catch share programs encompass a range of management strategies that share a common feature: a secure share of fish is dedicated to individual fishermen, cooperatives, fishing communities and other entities for their exclusive use. In 2010, the NOAA catch share policy was released to encourage well-designed catch share programs to help maintain or
rebuild fisheries. ${ }^{8}$ The policy also aims to sustain fishermen, communities and vibrant working waterfronts, including the cultural and resource-access traditions that have been part of this country since its founding.

Currently, there are 16 federal catch share programs nationwide. These programs include limited access privilege programs (LAPPs), individual fishing quota programs (IFQs), individual transferable quota programs (ITQs), fishing community development quota programs (CDQs), fishing cooperatives, and fishing sectors. ${ }^{9}$ Implementation dates of these programs span three decades, with five programs established in the 1990s and six programs established since 2010 (see Table 2). 10 programs manage a single species or, in some cases, two species but as separate management units; the other six programs manage multiple species. Most of the programs (six) operate in the Alaska Region.

Table 2. Existing Catch Share Programs in Federal Fisheries

| Region | Program | Year Implemented |
| :---: | :---: | :---: |
| Mid-Atlantic | Mid-Atlantic Surfclam \& Ocean Quahog ITQ | 1990 |

In 2010, NOAA Fisheries initiated an effort to track catch share program performance. ${ }^{11}$ Findings from the initial report show that existing catch share programs have ended the race to fish (in their respective fisheries) resulting in longer fishing seasons, safer working conditions and improved management performance. The report also shows that existing catch share programs have resulted in reduced fishing capacity to better match stock size, a management objective in the majority of catch share programs evaluated. Economic performance for the vessels remaining in the program improved, as measured by such metrics as revenue per vessel and average price.

Updated information on selected performance indicators is provided in Table 3. Briefly, results show that inflation-adjusted revenue from catch share species increased in 10 of the 15 programs and/or sub-components of the programs since their implementation. In addition, the number of active vessels decreased in all but one program (Central GOA Rockfish), while infla-tion-adjusted revenue per active vessel increased in all programs since their implementation. Further, results show that the annual catch limit (ACL) was exceeded for only one stock (Alaska halibut) in 2014.

## Policy Updates

The Atlantic Highly Migratory Species pelagic longline fishery in the Western Atlantic and Gulf of Mexico targets swordfish, yellowfin and bigeye tunas, and catches Atlantic bluefin tuna as bycatch. The fishery had substantial regulatory dead discards of bluefin tuna prior to 2015. For example, from 2012 to 2014, the estimate of dead discards ranged from 206 to 139 mt annually. In 2015, NOAA Fisheries implemented an Individual Bluefin Quota Catch Share Program in the fishery to reduce bluefin dead discards and increase accountability. During the first two years of operating under the new regulations, the fishery successfully accounted for bluefin tuna bycatch using allocated quota; leased quota among participants using an online system; and recorded pelagic longline hauls using electronic monitoring (video camera) systems. In 2015, the amount of estimated dead discards in the fishery was reduced substantially ( $88 \%$; from 139 mt in 2014 to 17 mt in 2015).

## Other Market-Based Management Tools

Vessel or permit buyback programs are another mar-ket-based tool used by fishery managers. Under these

[^4]programs, the government purchases fishing vessels or permits. Doing so permanently decreases the number of participants in the fishery and eases fishing-related pressure on marine resources. Recent buyback programs include BSAI Crab, Pacific Coast Groundfish, Longline CP Non-Pollock Groundfish, Southeast Alaska Purse Seine Salmon, and AFA Pollock.

License limitation programs (LLPs), also known as limited entry programs, are another management tool available to fishery managers. In these programs, the number of fishing vessels allowed to harvest a specific fish stock or stock complex is limited to fishermen or vessels with permission to fish. LLPs have been implemented in almost all federally managed commercial fisheries and in every region except the Caribbean.

Ecolabels are market-based tools offered by third-party entities. An ecolabeling program entitles a fishery product to bear a distinctive logo or statement that certifies the fishery resource was harvested in compliance with specified conservation and sustainability standards. It allows the buyer to potentially influence the sustainable harvest of fishery resources through the purchase of such ecolabeled seafood products at a price premium.

The Marine Stewardship Council (MSC) has one of the most recognizable ecolabeling programs in the world. Currently, nearly 300 fisheries worldwide meet MSC sustainability standards, 21 of which are U.S. fisheries (see Table 4). Fisheries obtaining MSC certification for the first time in 2015 include the SSLLC US North Atlantic swordfish longline fishery.

## NATIONAL OVERVIEW

In 2015, commercial and recreational fisheries in the United States generated 1.6 million jobs throughout the national economy. In addition, commercial and recreational fishing together generated $\$ 207.6$ billion in sales impacts, $\$ 62.4$ billion in income impacts, and $\$ 96.6$ billion in value-added impacts throughout the economy. Florida (176,500 jobs) supported the greatest number of fishing-related jobs overall. Florida also generated the greatest sales ( $\$ 28.7$ billion), income ( $\$ 7.5$ billion), and value-added ( $\$ 12.5$ billion) impacts from the commercial and recreational fishing industries combined.

Table 4. U.S. Fisheries with MSC Certificatio ${ }^{12}$

| Region | Fishery | Certifie |
| :---: | :---: | :---: |
| North Pacific | Alaska flatfish - Bering Sea \& Aleutian Islands | 2010 |
|  | Alaska flatfish - Gulf of Alaska | 2010 |
|  | Alaska Pacific cod - Bering Sea \& Aleutian Islands | 2010 |
|  | Alaska Pacific cod - Gulf of Alaska | 2010 |
|  | Alaska pollock - Bering Sea \& Aleutian Islands | 2010 |
|  | Alaska pollock - Gulf of Alaska | 2010 |
|  | American Western Fish Boat Owners Association albacore tuna North Pacific | 2010 |
|  | U.S. North Pacific halibut | 2006 |
|  | U.S. North Pacific sablefish | 2006 |
|  | Alaska salmon | 2000 |
| Pacific | American Albacore Fishing Association Pacific albacore tuna - north | 2007 |
|  | American Albacore Fishing Association Pacific albacore tuna - south | 2007 |
|  | Oregon pink shrimp | 2011 |

|  | U.S. West Coast limited entry groundfish trawl | 2014 |
| Gulf | Louisiana blue crab | 2012 |
| Northeast | Maine lobster trap fishery | 2013 |
|  | U.S. Atlantic spiny dogfish | 2012 |
|  | U.S. North Atlantic swordfish | 2013 |
|  | U.S. Atlantic sea scallop | 2013 |
|  | SSLLC US North Atlantic swordfish Iongline | 2015 |

## COMMERCIAL FISHERIES

In this report, commercial fisheries refer to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fishermen. It also excludes the for hire sector, which earns its revenue from selling recreational fishing trips to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and ex-vessel prices of key species/species groups.

## Key U.S. Commercial Species

- American lobster - Sablefish
- Blue crab - Sea scallop
- Menhaden - Shrimp
- Pacific halibut - Tunas
- Pacific salmon - Walleye pollock

## Regional Highlights

At the national level, this report includes landings revenue, landings, and prices for 10 key species or species groups, which were selected so that each region has at least one

[^5]species in the top 10. Results show that commercial fishermen in Alaska caught the most salmon (6 billion pounds) and earned $\$ 1.7$ billion for their catch in 2015. Tuna was caught in large numbers in Hawaii ( 23 million pounds) and generated $\$ 82$ million in landings revenue. Maine fishermen contributed the most to American lobster landings ( 122 million pounds) and earned $\$ 498$ million for their catch in 2015. In Massachusetts, sea scallopers harvested 22 million pounds landed and earned $\$ 265$ million for their catch. More blue crab was caught in Louisiana ( 41 million pounds) than in any other state, earning more than $\$ 58$ million. Louisiana accounted for the greatest quantity of menhaden landed in 2015, with fishermen landing 894 million pounds worth $\$ 85$ million in dockside revenue. Sea scallop garnered the highest average ex-vessel price per pound (\$12.32) from among the key species and species groups in 2015, with state-specific prices ranging from $\$ 11.15$ in North Carolina to $\$ 12.89$ in New Hampshire.

## Economic Impacts

The premise behind economic impact modeling is that every dollar spent in a regional economy (direct impact) is either saved or respent on additional goods or services. If those dollars are respent on other goods and services in the regional economy, this spending generates additional economic activity in the region. This report provides estimates of total economic impacts for the Nation and for each of the 23 coastal states. Total economic impacts for each state and the Nation represent the sum of direct impacts; indirect impacts (in this case, the impact from suppliers to the seafood industry); and induced impacts (spending by employees on personal and household expenditures, where employees of both seafood businesses and its full supply chain are included). That is, impacts from the seafood industry as well as the economic activity generated throughout each region's broader economy from this industry.

Four different measures are commonly used to show commercial fisheries landings affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as commercial fishing. It includes both the direct sales of fish landed and sales made between businesses and households resulting from the original sale. Income includes

Graph 1. Jobs supported by the U.S. Seafood Industry (With and Without Imports)

personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported directly or indirectly by the sales of seafood or purchases of inputs to commercial fishing. The first three types of measures are calculated in terms of dollars, whereas employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. The United States seafood industry is defined here as the commercial fishing sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers. ${ }^{13}$

In 2015, the seafood industry supported 1.2 million fulland part-time jobs and generated $\$ 144.2$ billion in sales, $\$ 39.7$ billion in income, and $\$ 60.6$ billion in value-added impacts nationwide. The retail sector generated the largest employment impacts across sectors at 573,000 jobs. The importers sector generated the largest sales impacts ( $\$ 58.3$ billion), the retail sector generated the largest income impacts ( $\$ 13.3$ billion), and the retail sector

[^6]Table 6. Sales, Income, and Value-Added Impacts Generated by the U.S. Seafood Industry, 2015 (\$ millions)

| State | Sales | Income | Value <br> Added |
| :--- | ---: | ---: | ---: |
| U.S. | $\$ 144,194$ | $\$ 39,744$ | $\$ 60,566$ |
| California | $\$ 21,315$ | $\$ 4,530$ | $\$ 7,553$ |
| Florida | $\$ 17,713$ | $\$ 3,319$ | $\$ 5,931$ |
| Massachusetts | $\$ 7,308$ | $\$ 1,906$ | $\$ 2,904$ |
| Alaska | $\$ 4,421$ | $\$ 1,877$ | $\$ 2,354$ |
| New Jersey | $\$ 5,969$ | $\$ 1,273$ | $\$ 2,102$ |
| New York | $\$ 5,374$ | $\$ 1,153$ | $\$ 1,905$ |
| Maine | $\$ 2,434$ | $\$ 803$ | $\$ 1,161$ |
| Washington | $\$ 1,702$ | $\$ 694$ | $\$ 942$ |
| Louisiana | $\$ 1,840$ | $\$ 673$ | $\$ 921$ |
| Virginia | $\$ 1,170$ | $\$ 407$ | $\$ 566$ |
| Texas | $\$ 1,017$ | $\$ 361$ | $\$ 510$ |
| Oregon | $\$ 1,058$ | $\$ 356$ | $\$ 504$ |
| New Hampshire | $\$ 1,559$ | $\$ 355$ | $\$ 571$ |
| Maryland | $\$ 1,330$ | $\$ 351$ | $\$ 532$ |
| Georgia | $\$ 1,416$ | $\$ 320$ | $\$ 523$ |
| North Carolina | $\$ 1,027$ | $\$ 286$ | $\$ 427$ |
| Hawaii | $\$ 814$ | $\$ 247$ | $\$ 362$ |
| Alabama | $\$ 502$ | $\$ 189$ | $\$ 251$ |
| Mississippi | $\$ 465$ | $\$ 186$ | $\$ 240$ |
| Rhode Island | $\$ 347$ | $\$ 117$ | $\$ 167$ |
| Connecticut | $\$ 493$ | $\$ 104$ | $\$ 173$ |
| South Carolina | $\$ 75$ | $\$ 30$ | $\$ 41$ |
| Delaware | $\$ 132$ | $\$ 24$ | $\$ 43$ |

generated the largest value-added and the retail sector generated the largest value-added impacts (\$18.2 bilIion); see Table 5.

The largest state-level employment impacts generated by the seafood industry occurred in California (114,000 jobs), followed by Massachusetts (83,000 jobs) and Florida (80,000 jobs); see Graph 1. The highest income impacts

Table 5. U.S. Seafood Industry Economic Impacts Trends (\$ billions)

|  | $\mathbf{2 0 1 2}$ | $\mathbf{2 0 1 3}$ | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 1 5}$ |
| :--- | ---: | ---: | ---: | ---: |
| Jobs | $1,270,141$ | $1,350,627$ | $1,394,833$ | $1,179,848$ |
| Sales | $\$ 140.70$ | $\$ 142.20$ | $\$ 153.30$ | 144.19 |
| Income | $\$ 38.70$ | $\$ 39.80$ | $\$ 42.00$ | 39.74 |
| Value-Added | $\$ 59.00$ | $\$ 60.30$ | $\$ 64.10$ | 60.57 |
| Total Revenue | $\$ 5.10$ | $\$ 5.60$ | $\$ 5.50$ | 5.17 |

were generated in California (\$4.5 billion), followed by Florida and Massachusetts. The highest sales impacts were generated by the seafood industry in California (\$21.3 billion), followed by Florida and Massachusetts. The highest value-added impacts were generated in California (\$7.6 billion), followed by Florida and Massachusetts (Table 6).

## Landings Trends

Landings revenue in the United States totaled $\$ 5.2$ billion in 2015 (Table 7). This was a 24\% increase in nominal value from 2006 levels (a 17\% increase in real terms after adjusting for inflation) and a year-over-year decrease of 6\% from 2014 (Graph 2). Finfish landings revenue accounted for $45 \%$ of all landings revenue. American lobster had the highest landings revenue in 2015.

## Landings Revenue

Landings revenue in the United States totaled $\$ 5.2$ billion in 2015 (Table 7). This was a 24\% increase in nominal value from 2006 levels (a 17\% increase in real terms after adjusting for inflation) and a year-over-year decrease of 6\% from 2014 (Graph 2). Finfish landings revenue accounted for 45\% of all landings revenue. American lobster had the highest landings revenue in 2015.

Graph 2. U.S. Commercial Fisheries Landings Revenue (nominal values, \$ millions)

## Landings Revenue: Largest Increases

From 2006:

- Menhaden ( $154 \%, 120 \%$ in real terms)
- Blue crab ( $75 \%, 51 \%$ in real terms)
- Tunas (58\%, 37\% in real terms)

From 2014:

- Menhaden (57\%)
- Walleye pollock ( $21 \%$ )
- American lobster (9\%)

## Landings Revenue: Largest Decreases

From 2006:

- Pacific halibut ( $-41 \%,-49 \%$ in real terms)

From 2014:

- Shrimp (-30\%)
- Pacific salmon (-25\%)

Table 7. Commercial Fisheries Landings Revenue by Region, 2015 (\$ millions)

| Region | Landings <br> Revenue | Region | Landings <br> Revenue |
| :--- | ---: | ---: | ---: |
| U.S. | $\$ 5,184$ | Pacific | $\$ 558$ |
| North Pacific | $\$ 1,733$ | Mid-Atlantic | $\$ 512$ |
| New England | $\$ 1,238$ | South Atlantic | $\$ 182$ |
| Gulf of Mexico | $\$ 858$ | Western Pacific | $\$ 103$ |

From 2006 to 2015, menhaden (154\%, 120\% in real terms); blue crab ( $75 \%, 51 \%$ in real terms); and tunas (58\%, $37 \%$ in real terms) had the largest revenue

## Landings: Largest Increases

From 2006:

- Pacific salmon (61\%)
- American lobster (52\%)
- Menhaden (25\%)

From 2014:

- Pacific salmon (48\%)
- Menhaden (32\%)
- Blue crab (15\%)

## Landings: Largest Decreases

From 2006:

- Pacific halibut (-66\%)
- Sea scallop (-41\%)
- Sablefish (-29\%)

From 2014:

- Tunas (-2\%)
- American lobster (-1\%)
increases, while Pacific halibut (-41\%, $-49 \%$ in real terms) had the largest decreases. From 2014 to 2015, menhaden (57\%), walleye pollock (21\%), and American lobster (9\%) had the largest revenue increases, while shrimp (-30\%) and Pacific salmon (-25\%) had the largest decreases.

Alaska earned the greatest share of landings revenue in 2015 ( $\$ 1.7$ billion), contributing 34\% of the national total (Table 8). Maine ( $\$ 539$ million, or $19 \%$ of U.S. shellfish revenue) and Massachusetts (\$425 million, or

Graph 3. U.S. Commercial Fisheries Landings (millions of pounds)

$15 \%$ of U.S. shellfish revenue) earned the most ex-vessel revenue from shellfish landings.

## Landings

Landings volume in the United States totaled 9.7 billion pounds in 2015 (Table 8). This was a 2\% increase from 2006 levels and a year-over-year increase of $2 \%$ from 2014 (Graph 3). Finfish landings accounted for $88 \%$ of all landed weight. Walleye pollock had the highest landings volume in 2015.

## Table 8. Commercial Fisheries Landings by Region, 2015 (millions of pounds)

| Region | Landings | Region | Landings |
| :--- | ---: | :--- | ---: |
| U.S. | 9,728 | Mid-Atlantic | 649 |
| North Pacific | 6,038 | New England | 599 |
| Gulf of Mexico | 1,555 | South Atlantic | 106 |
| Pacific | 747 | Western Pacific | 35 |

From 2006 to 2015, Pacific salmon (61\%), American lobster (52\%), and menhaden (25\%) had the largest landings increases, while Pacific halibut (-66\%), sea scallop (-41\%), and sablefish (-29\%) had the largest decreases. From 2014 to 2015, Pacific salmon (48\%), menhaden (32\%), and blue crab (15\%) had the largest landings increases, while tunas (-2\%) and American lobster (-1\%) had the largest decreases.

Alaska earned the greatest share of landings volume in 2015 (6 billion pounds), contributing 63\% of the national total (see Table 8). Louisiana (153 million pounds, or 14\% of U.S. shellfish landings) and Maine (138 million pounds, or $12 \%$ ) had the highest shellfish landings by volume.

## Price

Of all key species or species groups, sea scallop (\$12.32 per pound) had the highest national ex-vessel price. Menhaden ( $\$ 0.11$ per pound) had the lowest ex-vessel price of all key species nationally. From 2006 to 2015, menhaden (104\%, 80\% in real terms); sea scallop (92\%, 69\% in real terms); and blue crab ( $80 \%, 59 \%$ in real terms) had the largest price increases, while Pacific salmon ( $-8 \%$, $-21 \%$ in real terms) had the largest decrease. From 2014 to 2015, menhaden (19\%), walleye pollock (16\%), and American lobster (10\%) had the largest price increases, while Pacific salmon ( $-50 \%$ ), shrimp ( $-32 \%$ ), and blue crab ( $-10 \%$ ) had the largest decreases.

## RECREATIONAL FISHERIES

In this report, recreational fisheries refer to fishing for fun rather than to resell fish (commercial fishing) or for subsistence. The recreational fisheries section reports on angler participation, trips, economic impacts and expenditures, and catch of key species/species groups.

## Key U.S. Recreational Species

- Atlantic croaker and - Pacific Salmon
spot
- Little tunny and Atlantic bonito
- Pacific halibut
- Rockfishes and scorpionfishes
- Seatrout
- Sharks
- Striped bass
- Summer flounder
- Tunas

## Regional Highlights

At the national level, the report includes fishing trips, participation, and the harvest and release numbers of 10 key species or species groups, which were selected so that each region has at least one species in the top 10. Results show that in 2015, recreational anglers in West Florida took the most trips ( 13.4 million trips) and spent the most on trips ( $\$ 663$ million). California spent the second most on trips (\$399 million). West Florida also had the most recreational anglers participate in fishing in their state, with 3.8 million anglers. Of these participants, $63 \%$ were from out of state. West Florida caught the most drum (seatrouts, 9.5 million fish), Virginia caught the most drum (Atlantic croaker and spot, 7.5 million fish), and New Jersey caught the most summer flounder ( 5.2 million fish). Alaska caught the most Pacific halibut (691 million fish), and more striped bass ( 3.5 million fish) was caught in Maryland than any other state.

## Economic Impacts and Expenditures

The contribution of recreational fishing activities in the United States are reported in terms of economic impacts from angler expenditures. ${ }^{14,15}$ Total annual trip expenditures are estimated by multiplying mean trip expenditures by the estimated number of adult trips in each trip mode (for-hire, private boat, and shore). Total annual durable expenditures are estimated by multiply

[^7]Table 9. Recreational Economic Impacts Trends for the United States (\$ billions)

|  | $\mathbf{2 0 1 2}$ | $\mathbf{2 0 1 3}$ | $\mathbf{2 0 1 4}$ | $\mathbf{2 0 1 5}$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Number of Jobs | 425,321 | 420,191 | 438,590 | 439,242 |
| Sales | $\$ 58.80$ | $\$ 58.10$ | $\$ 60.60$ | $\$ 63.44$ |
| Income | $\$ 21.40$ | $\$ 21.10$ | $\$ 22.00$ | $\$ 22.68$ |
| Value-Added | $\$ 34.40$ | $\$ 34.00$ | $\$ 35.50$ | $\$ 36.08$ |
| Total Trips (millions) | 72 | 71.9 | 68 | 60.9 |

Table 10. Sales, Income, and Value-Added Impacts Generated by the Recreational Fishing Industry, 2015 (\$ millions)

| State | Sales | Income | Value Added |
| :--- | ---: | ---: | ---: |
| U.S. | $\$ 63,440$ | $\$ 22,679$ | $\$ 36,082$ |
| West Florida | $\$ 6,948$ | $\$ 2,620$ | $\$ 4,185$ |
| East Florida | $\$ 4,020$ | $\$ 1,515$ | $\$ 2,427$ |
| California | $\$ 2,079$ | $\$ 797$ | $\$ 1,271$ |
| Texas | $\$ 1,938$ | $\$ 726$ | $\$ 1,202$ |
| New Jersey | $\$ 1,839$ | $\$ 786$ | $\$ 1,225$ |
| North Carolina | $\$ 1,450$ | $\$ 560$ | $\$ 871$ |
| Louisiana | $\$ 1,286$ | $\$ 474$ | $\$ 784$ |
| Alabama | $\$ 1,245$ | $\$ 532$ | $\$ 889$ |
| Massachusetts | $\$ 986$ | $\$ 455$ | $\$ 657$ |
| New York | $\$ 874$ | $\$ 377$ | $\$ 587$ |
| Washington | $\$ 775$ | $\$ 297$ | $\$ 483$ |
| Maryland | $\$ 724$ | $\$ 301$ | $\$ 470$ |
| South Carolina | $\$ 676$ | $\$ 245$ | $\$ 397$ |
| Mississippi | $\$ 656$ | $\$ 218$ | $\$ 354$ |
| Alaska | $\$ 619$ | $\$ 223$ | $\$ 362$ |
| Virginia | $\$ 521$ | $\$ 213$ | $\$ 337$ |
| Connecticut | $\$ 367$ | $\$ 159$ | $\$ 248$ |
| Rhode Island | $\$ 332$ | $\$ 141$ | $\$ 217$ |
| Oregon | $\$ 314$ | $\$ 139$ | $\$ 202$ |
| Georgia | $\$ 142$ | $\$ 59$ | $\$ 93$ |
| Hawaii | $\$ 119$ | $\$ 37$ | $\$ 60$ |
| Delaware | $\$ 100$ | $\$ 40$ | $\$ 65$ |
| Maine | $\$ 65$ | $\$ 24$ | $\$ 39$ |
| New Hampshire | $\$ 50$ | $\$ 21$ | $\$ 30$ |

ing mean durable expenditures by the estimated annual number of adult participants in a given state.

Four different measures are commonly used to show how angler expenditures affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as recreational fishing. It includes both the direct sales made by the angler and sales made between businesses and households resulting from that original sale by the angler. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported

Graph 4. Jobs Supported by the U.S. Recreational Fishing Industry

directly or indirectly by the purchases made by anglers. The first three types of measures are calculated in terms of dollars, whereas employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. NOAA Fisheries uses a regional impact modeling software, called IMPLAN, to estimate these four types of impacts.

Economic impacts from recreational fishing activities supported 439,000 jobs across the United States in 2015 (see Table 9). Recreational fishing also generated more than $\$ 63$ billion in sales impacts, $\$ 23$ billion in income impacts, and $\$ 36$ billion in value-added impacts. Impacts from durable equipment expenditures (e.g., rods and reels, fishing-related equipment, boats, vehicles, and second homes) accounted for $85 \%$ of total job impacts, $84 \%$ of sales impacts, $86 \%$ of income impacts, and $85 \%$ of value-added impacts. Of the three fishing trip modes, private-boat-based fishing trips had the greatest economic impact, accounting for 5\% of employment, $6 \%$ of sales, $5 \%$ of income impacts, and 5\% of value-added impacts. The greatest employment impacts from saltwater recreational fishing were generated in West Florida, followed by East Florida and California (see Graph 4).

## Graph 5. Recreational Fishing Trip and Durable Expenditures, 2015 (\$ millions)

The highest sales impacts were generated in West Florida, followed by East Florida and California (see Table 10).

In 2015, expenditures for fishing trips and durable equipment in the United States totaled $\$ 28.7$ billion. Approximately $\$ 4.5$ billion of these expenditures were
related to trip expenses. Total trip expenditures consisted of expenses on trips in the private boat (40\%), shore ( $31 \%$ ), and for-hire (29\%) sectors. Durable goods expenditures totaled $\$ 24.3$ billion in 2015, with the largest portion coming from boat expenses (\$14.1 billion).

## Fishing Trips

Nationwide, anglers took approximately 60.9 million saltwater fishing trips around the country (see Table 11). ${ }^{16}$ This number was a $27 \%$ decrease from 2006 and a $10 \%$ decrease from 2014 (Graph 6). The private boat mode accounted for $48 \%$ of fishing trips. The largest percentage increase in trips from 2006 occurred in the for-hire mode (15\%). West Florida took the most fishing trips (13.4 million trips), followed by East Florida and North Carolina (see Table 12).

Table 11. Recreational Fishing Trips by Region, 2015 (millions of fishing trips)

| Region | Trips |
| :--- | ---: |
| U.S. | 60.9 |
| Gulf of Mexico | 19.7 |
| South Atlantic | 16.5 |
| Mid-Atlantic | 12.4 |
| Pacific | 5.8 |
| New England | 5.0 |
| Hawai'i | 1.4 |

## Participation

Nationwide, 8.9 million recreational saltwater anglers fished in their home states in 2015. ${ }^{17}$ This number was a 33\% decrease from 2006 and a 14\% decrease from 2014 (Graph 6). Coastal county residents made up 86\%

Graph 6. Recreational Fishing Trips, 2006-2015 (thousands of angler trips)

[^8]of this total while non-coastal county residents made up $14 \%$. West Florida had the highest participation of anglers ( 3.8 million anglers), followed by East Florida ( 1.8 million anglers) and North Carolina ( 1.5 million anglers).

Table 12. Recreational Fishing Trips by State, 2015 (thousands of trips)

| State | Trips | State | Trips |
| :--- | ---: | :--- | ---: | ---: |
| West Florida | 13,425 | Virginia | 2,083 |
| EastFlorida | 8,634 | Mississippi | 1,551 |
| North Carolina | 4,646 | Hawaii | 1,431 |
| New Jersey | 4,287 | Washington | 1,342 |
| California | 3,741 | Connecticut | 1,341 |
| New York | 3,235 | Rhode Island | 879 |
| South Carolina | 2,670 | Oregon | 711 |
| Louisiana | 2,426 | Georgia | 590 |
| Alabama | 2,324 | Delaware | 495 |
| Maryland | 2,319 | Maine | 414 |
| Massachusetts | 2,181 | New Hampshire | 221 |

## Harvest and Release

In 2015, drum (seatrouts, 28 million fish), drum (Atlantic croaker and spot, 25.6 million fish), and summer flounder ( 12.2 million fish) were most frequently caught by recreational anglers in the United States. ${ }^{18}$ From 2006 to 2015, rockfishes \& scorpionfishes (43\%), Pacific salmon (15\%), and tunas (Thunnus species, $11 \%$ ) had the largest increases in catch, while striped bass (-62\%), summer flounder (-44\%), and drum (seatrouts) ( $-43 \%$ ) had the largest decreases. From 2014 to 2015, drum (seatrouts, 13\%); Pacific salmon (8\%); and striped bass (7\%) had the largest increases in catch, while little tunny \& Atlantic bonito (-38\%), summer flounder (-36\%), and drum (Atlantic croaker \& spot) $(-24 \%)$ had the largest decreases.

## MARINE ECONOMY

For this report, the marine economy refers to the economic activity generated by fishing and marine-related industries in a coastal state. The national marine economy consists of two industry sectors: 1) seafood sales and processing (employer establishments and non-employer firms); and 2) transport, support, and marine operations (employer establishments). These sectors include several different marine-related industries. Note that Census Bureau data for the Marine Economy section of this report is available only through 2014. Percentage changes in inflation-adjusted (real dollar) terms are calculated using

## Harvest and Release: Largest Increases

From 2006:

- Rockfishes \& scorpionfishes (43\%)
- Pacific salmon (15\%)
- Tunas (Thunnus species) (11\%)

From 2014:

- Drum (seatrouts) (13\%)
- Pacific salmon (8\%)
- Striped bass (7\%)

## Harvest and Release: Largest Decreases

From 2006:

- Striped bass (-62\%)
- Summer flounder (-44\%)
- Drum (seatrouts) (-43\%)

From 2014:

- Little tunny \& Atlantic bonito (-38\%)
- Summer flounder (-36\%)
- Drum (Atlantic croaker \& spot) (-24\%)
the annual implicit price deflator GDP time series published by the U.S. Bureau of Economic Analysis and the Federal Reserve Bank of St. Louis. ${ }^{19}$

The Commercial Fishing Location Quotient (CFLQ) measures the proportional size of this sector in a state's economy relative to the size of the commercial fishing sector in the national economy. ${ }^{20}$ The CFLQ is calculated as the ratio of the percentage of regional employment in the commercial fishing sector relative to the percentage of national employment in the commercial fishing sector. The U.S. CFLQ is 1 . If a state CFLQ is less than 1 , then less commercial fishing occurs in this state than the national average. If a state CFLQ is greater than 1 , then more commercial fishing occurs in this state than the national average.

In 2014, 7.6 million establishments operated throughout the entire U.S. economy, including marine and non-marine related establishments. ${ }^{21}$ These establishments employed more than 121 million workers and had a total annual payroll of $\$ 5.9$ trillion. The nation's gross domestic product was approximately $\$ 17$ trillion in 2014.

[^9]
## Seafood Sales and Processing

Seafood Product Preparation and Packaging: In 2014, there were 1,947 non-employer firms (a 70\% increase from 2006) and annual receipts totaled $\$ 147$ million (a 60\% increase from 2006 in real terms). More of these firms were located in Florida (315), New York (181), and California (164) than any other state. There were 640 employer establishments (a 4\% decrease from 2006) in 2014. These establishments employed approximately 32,180 workers (a $10 \%$ decrease from 2006) and had a total annual payroll of $\$ 1.3$ billion (a 5\% decrease from 2006 in real terms). More of these establishments were located in Alaska (108) and Washington (90) than any other state.

Seafood Sales, Retail: In 2014, there were 2,557 non-employer firms engaged in retail seafood sales (a 22\% increase from 2006) and annual receipts totaled $\$ 203$ million (a 16\% decrease from 2006 in real terms). More of these firms were located in Florida (346), California (227), and Texas (199) than in any other state.

There were 2,015 employer establishments (a $5 \%$ decrease from 2006) in 2014. These establishments employed 11,037 workers (a 5\% increase from 2006) and had a total annual payroll of $\$ 272$ million (a $18 \%$ increase from 2006 in real terms). More of these establishments were located in New York (401), California (167), and Florida (166) than any other state.

Seafood Sales, Wholesale: There were 2,100 establishments (a 5\% decrease from 2006) in 2014. These establishments employed 21,155 workers (a $4 \%$ decrease from 2006) and had a total annual payroll of $\$ 911$ million (a 4\% decrease from 2006 in real terms). More seafood wholesalers were located in California (341), New York (270), and Florida (233) than any other state.

## Transport, Support, and Marine Operations

In the U.S. transport, support, and marine operations industry sector, marinas had the highest number of establishments (3,811; a 5\% decrease from 2006) in 2014. More marinas were located in Florida (464), New York (427), and California (249) than any other state.

Ship and boat building employed the highest number of workers (138,687; a 2\% decrease from 2006) and had the highest annual payroll ( $\$ 7.9$ billion; a $17 \%$ increase from 2006 in real terms).

[^11]
## North Pacific Region

## MANAGEMENT CONTEXT

The North Pacific Region includes the fisheries in the Exclusive Economic Zone (EEZ) off the state of Alaska. Federal fisheries in this region are managed by the North Pacific Fishery Management Council (NPFMC) and NOAA Fisheries under six fishery management plans (FMPs).

## North Pacific Region FMPs

- Bering Sea/ Aleutian Islands (BSAI) groundfish
- Gulf of Alaska (GOA) groundfish
- BSAI king and tanner crabs
- Alaska scallop
- Salmon in the EEZ
- Arctic

Of the stocks or stock complexes covered in these FMPs, only the blue king crab-Pribilof Islands stock is listed as overfished. No stocks or stock complexes in this region are subject to overfishing.

## Catch Share Programs

The North Pacific Region has six catch share programs, more than any other region. These are the: 1) Western Alaska Community Development Quota (CDQ) Program; 2) Alaska Halibut and Sablefish Individual Fishing Quota (IFQ) Program; 3) American Fisheries Act (AFA) Pollock Cooperatives; 4) Bering Sea and Aleutian Islands (BSAI) Crab Rationalization Program; 5) Bering Sea and Aleutian Islands (BSAI) Non-Pollock Trawl Catcher/ Processor Groundfish Cooperatives (Amendment 80); and 6) Central Gulf of Alaska Rockfish Program. The landings revenues for these programs totaled \$981.9 million in 2014, exceeding the total landings revenue of any other state. Following are descriptions of these catch share programs and their performance.

## Western Alaska Community Development

 Quota (CDQ) Program: The program was originally implemented in 1992 as part of a restructuring of the BSAI groundfish fishery. Under this program, a percentage of the total allowable catch for groundfish, prohibited species, halibut, and crab is apportioned to 65 eligible villages in Western Alaska that are organized into six CDQ groups. The program has the following goals: 1) Provide eligible Western Alaska villages withthe opportunity to participate and invest in fisheries in the Bering Sea and Aleutian Islands Management Area; 2) Support economic development in Western Alaska; 3) Alleviate poverty and provide economic and social benefits to residents; and 4) Achieve a sustainable and diversified local economy.

Alaska Halibut and Sablefish IFQ Program: The program was implemented in 1995. The primary objectives of this IFQ program include the following: 1) Eliminate gear conflicts; 2) Address safety concerns; and 3) Improve product quality. The performance results of the halibut fishery show that, relative to its baseline period (3-year period prior to implementation), the following indicators decreased: 2014 quota, landings, and active vessels. However, inflation-adjusted halibut revenue and revenue per vessel increased. The 2014 performance results for the sablefish fishery show that quota, landings, inflationadjusted revenue, and number of active vessels decreased, while inflation-adjusted revenue per vessel increased.

## American Fisheries Act (AFA) Pollock

Cooperatives: The program was established in 1999 and 2000 with the goals of settling allocation disputes between inshore (catcher vessels), offshore (catcher/processors), and mothership sectors and ending the race for fish. Key performance indicators of this program show that relative to its baseline, the 2014 quota, landings, inflation-adjusted revenue, and revenue per vessel increased. However, the number of active vessels decreased.

## Bering Sea and Aleutian Islands (BSAI) Crab Rationalization Program: The program was

 implemented for the 2005-2006 crab fishing season to address the race to harvest; high bycatch and discard mortality; and product quality issues. The program also aims to balance the interests of those who depend on crab fisheries. This program includes share allocations to harvesters and processors. Processor quota was incorporated to preserve the viability of processing facilities in dependent communities and, particularly, to maintain competitive conditions in ex-vessel markets. The CDQ and Adak Community allocations, regionallandings and processing requirements, and several community protection measures protect community interests. The key 2014 performance indicators of this program show that, relative to its baseline, the quota, landings, and number of active vessels decreased. However, inflation-adjusted revenue and revenue per active vessel increased.

## BSAI Non-Pollock Trawl Catcher/Processor

 Groundfish Cooperatives: The program, commonly referred to as the Amendment 80 Program, was implemented in 2008 to create economic incentives that would improve retention of all fish caught. The cooperatives also seek to reduce bycatch by commercial fishing vessels using trawl gear in the non-pollock groundfish fisheries. Key 2014 performance indicators of this program show that, relative to its baseline, quota, landings, and inflation-adjusted revenue per vessel increased. However, the number of active vessels and inflation-adjusted revenue declined.Central Gulf of Alaska Rockfish Program: The program was initially established as a 2-year (20072008) pilot program by the U.S. Congress and was later extended to 5 years. NOAA Fisheries implemented this catch share program in 2012. The objectives of this program are to reduce bycatch and discards, encourage conservation-minded practices, improve product quality and value, and provide stability to the processing labor force. Results show that in 2014, the quota, landings, number of active vessels, inflation-adjusted revenue, and revenue per active vessel increased relative to the baseline.

## Policy Updates

Salmon bycatch in the Bering Sea pollock fishery is an important management challenge in the North Pacific. On one hand, this challenge involves the largest fishery in the United States with approximately 25\% of total landings. On the other hand, salmon, especially Chinook in Western Alaska rivers, is arguably the most important subsistence fishery in the United States. Prior to 2011, fixed salmon time-area closures and dynamic "rolling hot spot" closures were used to protect salmon. However, the council concluded that these measures were not reducing bycatch sufficiently. In 2011,

Amendment 91 to the BSAI Fishery Management Plan established Chinook catch limits ("hard caps") that were allocated at the cooperative and vessel level. These and other vessel-level incentives were implemented to encourage bycatch reduction at lower levels of salmon encounters and abundance when the hard cap might not strongly constrain the fishery. In 2015, the council passed additional measures to reduce Chinook and chum bycatch, including penalties for vessels with high bycatch rates, salmon excluder device requirements, seasonal reallocation of pollock quota, and hard cap reductions in years of low Chinook in-river abundance.

In June 2015, the NPFMC also recommended the reduction of halibut bycatch limits in the BSAI groundfish fisheries. The bycatch limits were reduced $21 \%$, from 4,426 metric tons to 3,515 metric tons. The new limits were apportioned among sector and gear types and different reductions were applied to each. The Gulf of Alaska halibut bycatch limits incorporate measures to minimize adverse economic impacts on fishing industry sectors and will be phased in during a 3-year period that started in 2014.

Also in 2015, NOAA Fisheries proposed regulations to implement a cost-recovery fee program for the Western Alaska CDQ Program for groundfish and three limited access privilege programs (LAPPs; AFA, Aleutian Islands Pollock, and Amendment 80 fisheries). The cost-recovery fees will make up for the actual costs directly related to the management, data collection efforts, and enforcement of the programs. However, the fees cannot exceed 3\% of the annual ex-vessel value of fish harvested by a program that is subject to the cost-recovery fee. The cost-recovery programs were subsequently implemented in February 2016.

## COMMERCIAL FISHERIES

In this report, commercial fisheries refer to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fishermen. It also excludes the for hire sector, which earns its revenue from selling recreational fishing trips to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and ex-vessel prices of key species/species groups.

## Key North Pacific Commercial Species

- Atka mackerel
- Pacific herring
- Crab
- Flatfish
- Pacific cod
- Pacific halibut
- Rockfish
- Sablefish
- Salmon
- Walleye pollock

The North Pacific groundfish fishery is different from most other United States fisheries in that a large portion of the fishery is processed at sea and, therefore, no landings revenues are reported. The landings revenue for the species landed and processed at sea is estimated by using prices obtained from the shore-side sector. These species include Atka mackerel, flatfish, Pacific cod, rockfish, sablefish, and walleye pollock. When data from the shore-side sector are inadequate, historical information about the relationship between the ex-vessel price and the wholesale price of finished products is used to estimate ex-vessel prices and revenue for portions of the fishery mostly processed at sea.

In this report, the United States seafood industry includes the commercial harvest sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers.

## Economic Impacts

The premise behind economic impact modeling is that every dollar spent in a regional economy (direct impact) is either saved or respent on additional goods or services. If those dollars are respent on other goods and services in the regional economy, this spending generates additional economic activity in the region. This report provides estimates of total economic impacts for the Nation and for each of the 23 coastal states. Total economic impacts for each state and the Nation represent the sum of direct impacts; indirect impacts (in this case, the impact from suppliers to the seafood industry); and induced impacts (spending by employees on personal and household expenditures, where employees of both seafood businesses and its full supply chain are included). That is, impacts from the seafood industry as well as the economic activity generated throughout each region's broader economy from this industry.

Four different measures are commonly used to show commercial fisheries landings affect the economy in a region (state or nationwide): sales, income, valueadded, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as commercial fishing. It includes both the direct sales of fish landed and sales made between businesses and households resulting from the original sale. Income includes personal income (wages and salaries) and proprietors' income (income from selfemployment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported directly or indirectly by the sales of seafood or purchases of inputs to commercial fishing. The first three types of measures are calculated in terms of dollars, whereas employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. The United States seafood industry is defined here as the commercial fishing sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers. ${ }^{1}$

In 2015, Alaska's commercial fishing and seafood industry generated $\$ 4.4$ billion in sales impacts, $\$ 1.9$ billion in income impacts, $\$ 2.4$ billion in value-added impacts, and 53,400 full- and part-time jobs. The commercial harvesters sector generated the largest employment impacts across sectors with 38,000 jobs. The commercial harvesters sector generated the largest sales impacts ( $\$ 3.1$ billion), the largest income impacts ( $\$ 1.3$ billion), and the largest value-added impacts ( $\$ 1.6$ billion).

## Landings Trends

While total landings revenue were unchanged from 2014, at the species/species group level there was considerable variation. Most notably salmon landings revenue was down $\$ 133$ million (24\%) from 2014 levels despite records landings, which almost doubled from 2014 levels. Market reports attributed landings revenue declines to a strong dollar, which weakened demand in Japan and the European Union (EU), as well as the Russian import ban on food products from the US, Canada, Norway and the EU. Surging supplies of pink salmon (up 95\%), which is consistent with the biennial cycle of pink salmon runs, and chum salmon

[^12]
## Landings Revenue: Largest Increases

From 2006:

- Crab (157\%, 122\% in real terms)
- Atka mackerel (106\%, 78\% in real terms)
- Rockfish (62\%, $40 \%$ in real terms)

From 2014:

- Crab (157\%, 122\% in real terms)
- Atka mackerel (106\%, 78\% in real terms)
- Rockfish (62\%, $40 \%$ in real terms)

## Landings Revenue: Largest Decreases

From 2006:

- Pacific halibut ( $-43 \%,-50 \%$ in real terms)
- Pacific herring ( $-6 \%,-18 \%$ in real terms)

From 2014:

- Pacific herring (-39\%)
- Salmon (-24\%)
- Flatfish (-23\%)
(up 49\%) coupled with significant increases in sockeye salmon landings (up 18\%) in an already weak market only served to further dampen prices. With the Russia ban also covering farmed salmon, the market for wild caught salmon faced further pressure from that source. The USDA purchase of $\$ 30$ million of canned sockeye salmon helped reduce inventories but was not sufficient to prevent sockeye prices falling from $\$ 1.39$ per pound in 2014 to \$0.69 in 2015.

Pacific herring landings revenue was down 39\% (\$4.5 million) during this period. A soft market, in part due to the Russia import ban, had an effect on both landings and price. In addition, a reduction in the harvest limit for the Sitka Sound sac roe fishery of almost $50 \%$ (7,600 tons) also contributed to the decline in landings revenue.

After adjusting for inflation, crab landings revenue ( $\$ 284$ million) was at its highest level since 1999. Southern tanner crab landings revenue ( $\$ 41$ million) increased $\$ 20$ million from 2014; snow crab landings revenue ( $\$ 133$ million) was up $\$ 18$ million; and king crab ( $\$ 99$ million) was up $\$ 13$ million. Only dungeness crab landings revenue fell relative to 2014, which had been a somewhat anomalous year for that species that included near record high prices (second highest on

## Landings: Largest Increases

From 2006:

- Rockfish (90\%)
- Crab (76\%)
- Salmon (64\%)

From 2014:

- Atka mackerel (69\%)
- Salmon (52\%)
- Crab (42\%)

## Landings: Largest Decreases

From 2006:

- Pacific halibut (-67\%)
- Sablefish (-33\%)
- Pacific herring (-14\%)

From 2014:

- Pacific herring (-29\%)
- Flatfish (-23\%)
- Sablefish (-7\%)
record after adjusting for inflation) and landings that exceeded the most recent $5-y e a r$ average by $51 \%$.

Walleye pollock landings revenue (\$509 million), up $21 \%$ or $\$ 87$ million from 2014, was also a bright spot for 2015. An uptick in landings revenue largely attributable to the $3.39 \%$ increase in the BSAI TAC and slightly higher prices drove pollock landings revenue up. Also noteworthy in 2015, the legal market name of "Alaska pollock" was changed to "pollock." This change prevents pollock caught elsewhere such as in Russia from being labeled "Alaska pollock" and thus provides greater clarity to consumers on where their seafood was harvested.

## Landings Revenue

In 2015, landings revenue totaled about $\$ 1.7$ billion, a $32 \%$ increase from 2006 (a 25\% increase in real terms after adjusting for inflation) and remained unchanged from 2014. Finfish landings revenue accounted for $83 \%$ of all landings revenue. In 2015, walleye pollock (\$509 million), salmon ( $\$ 413$ million), and crab ( $\$ 284$ million) dominated landings revenue. From 2006 to 2015, crab (157\%, 122\% in real terms); Atka mackerel (106\%, $78 \%$ in real terms); and rockfish (62\%, $40 \%$ in real terms) had the largest revenue increases, while Pacific halibut ( $-43 \%,-50 \%$ in real terms) and Pacific herring
(-6\%, $-18 \%$ in real terms) had the largest decreases. From 2014 to 2015, Atka mackerel (23\%), walleye pollock (21\%), and crab (20\%) had the largest revenue increases, while Pacific herring (-39\%), salmon (-24\%), and flatfish ( $-23 \%$ ) had the largest decreases.

## Landings

In 2015, commercial fishermen in the North Pacific Region landed more than 6 billion pounds of finfish and shellfish, an 11\% increase from 2006 and a 6\% increase from 2014. Walleye pollock contributed the most to landings, accounting for $54 \%$ of total volume. From 2006 to 2015, rockfish (90\%), crab (76\%), and salmon (64\%) had the largest landings increases, while Pacific halibut (-67\%), sablefish (-33\%), and Pacific herring ( $-14 \%$ ) had the largest decreases. From 2014 to 2015, Atka mackerel (69\%), salmon (52\%), and crab (42\%) had the largest landings increases, while Pacific herring (-29\%), flatfish (-23\%), and sablefish (-7\%) had the largest decreases.

## Price

In 2015, Pacific halibut ( $\$ 4.85$ per pound) received the highest ex-vessel price in the North Pacific Region. Landings of Pacific herring ( $\$ 0.1$ per pound) had the lowest ex-vessel price. From 2006 to 2015, Atka mackerel (129\%, $98 \%$ in real terms); Pacific halibut ( $74 \%, 50 \%$ in real terms); and sablefish (52\%, 32\% in real terms) had the largest price increases, while flatfish ( $-24 \%,-35 \%$ in real terms); rockfish ( $-15 \%,-26 \%$ in real terms); and Pacific cod ( $-10 \%,-22 \%$ in real terms) had the largest decreases. From 2104 to 2015, walleye pollock (16\%), Pacific cod (16\%), and sablefish (7\%) had the largest price increases, while salmon (-50\%), Atka mackerel (-27\%), and crab (-16\%) had the largest decreases.

## RECREATIONAL FISHERIES

In this report, recreational fisheries refer to fishing for fun rather than to resell fish (commercial fishing) or for subsistence. The recreational fisheries section reports on economic impacts and expenditures, angler participation, trips, and catch of key species/species groups.

## Key North Pacific Recreational Species

- Chinook salmon
- Pacific halibut
- Chum salmon - Pink salmon
- Coho salmon - Razor clams
- Greenlings • Rockfish
(lingcod)
- Sockeye salmon

## Economic Impacts and Expenditures

The contribution of recreational fishing activities ${ }^{2}$ in the United States are reported in terms of economic impacts from angler expenditures. Total annual trip expenditures are estimated by multiplying mean trip expenditures by the estimated number of adult trips in each trip mode (for-hire, private boat, and shore). Total annual durable expenditures are estimated by multiplying mean durable expenditures by the estimated annual number of adult participants in a given state.

Four different measures are commonly used to show how angler expenditures affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as recreational fishing. It includes both the direct sales made by the angler and sales made between businesses and households resulting from that original sale by the angler. Income includes personal income (wages and salaries) and proprietors' income (income from selfemployment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full- and part-time jobs supported directly or indirectly by the purchases made by anglers. The first three measures are calculated in terms of dollars, whereas employment impacts are measured in terms of number of jobs. Note that these categories are not additive. NOAA Fisheries uses a regional impact modeling software, called IMPLAN, to estimate these four types of impacts.

Economic impacts from recreational fishing activities in Alaska totaled 5,407 jobs in 2015 and generated \$619 million in sales, \$223 million in income, and \$362 million in value-added impacts. Impacts from durable

[^13]equipment expenditures (e.g., rods and reels, fishingrelated equipment, boats, vehicles, and second homes) accounted for $29 \%$ of employment, $19 \%$ of sales, $21 \%$ of income, and $20 \%$ of value-added impacts. Of the three fishing trip modes, trips in the for-hire mode had the greatest economic impact, accounting for $37 \%$ of employment impacts.

Expenditures for fishing trips and durable equipment across Alaska in 2015 totaled more than $\$ 469$ million. Approximately $\$ 347$ million of these expenditures were related to trip expenses, with a large portion coming from trips in the private boat (48\%) and for-hire (47\%) sectors. In 2015, durable goods expenditures were more than $\$ 122$ million, with the largest portion coming from boat expenses ( $\$ 57$ million).

## Days Fished

The state of Alaska records recreational fishing effort in terms of the number of days fished rather than the number of fishing trips. Anglers who fished in Alaska spent approximately 975,000 days fishing in 2015. ${ }^{3}$ This number was a $4 \%$ increase from the days spent fishing in 2006. From 2014 to 2015, there was a $2 \%$ increase in the number of days fished.

## Participation

In 2015, 309,000 recreational saltwater anglers fished in Alaska. This number was a 3\% decrease from 2006 and an 8\% increase from 2014. These anglers are categorized as either residents of coastal/non-coastal counties (41\%) or out-of-state anglers (59\%).

## Harvest and Release

Of Alaska's key species and species groups, Pacific halibut (691,000 fish), coho salmon (578,000 fish), and rockfish species (475,000 fish) were most frequently caught by recreational anglers. From 2006 to 2015, sockeye salmon (50\%), rockfish species (41\%), and pink salmon (35\%) had the largest increases in catch, while razor clams (-92\%), lingcod (-38\%), and chum salmon (-21\%) had the largest decreases. From 2014 to 2015, pink salmon (68\%), coho salmon (28\%), and chum salmon (23\%) had the largest increases in catch, while razor clams (-58\%), sockeye salmon (-11\%), and lingcod (-10\%) had the largest decreases.

## Recreational Catch: Largest Increases

From 2006:

- Sockeye salmon (50\%)
- Rockfish species (41\%)
- Pink salmon (35\%)

From 2014:

- Pink salmon (68\%)
- Coho salmon (28\%)
- Chum salmon (23\%)

## Recreational Catch: Largest Decreases

From 2006:

- Razor clams (-92\%)
- Lingcod (-38\%)
- Chum salmon (-21\%)

From 2014:

- Razor clams (-58\%)
- Sockeye salmon (-11\%)
- Lingcod (-10\%)

## MARINE ECONOMY

For this report, the marine economy refers to the economic activity generated by fishing and marinerelated industries in a coastal state. The state marine economy consists of two industry sectors: 1) seafood sales and processing (employer establishments and non-employer firms); and 2) transport, support, and marine operations (employer establishments). These sectors include several different marine-related industries. ${ }^{4,5}$

To measure the size of the commercial fishing sector in a state's economy relative to the size of the commercial fishing sector in the national economy ${ }^{6}$, researchers use an index called the Commercial Fishing Location Quotient (CFLQ). The CFLQ is calculated as the ratio of the percentage of regional employment in the commercial fishing sector relative to the percentage of national employment in the commercial fishing sector. The U.S. CFLQ is 1 . If a state's CFLQ is less than 1 , then less commercial fishing occurs in this state than the national average. If a state's CFLQ is greater than 1, then more commercial fishing occurs in this state than the national average. The Bureau of Labor Statistics did not disclose CFLQ data for Alaska for 2014.

[^14]In 2014, 21,000 establishments operated throughout Alaska, including marine and non-marine-related establishments. These establishments employed 267,000 workers and had a total annual payroll of more than $\$ 15$ billion. The region's gross domestic product was approximately \$57 billion in 2014.

## Seafood Sales and Processing

## Seafood Product Preparation and Packaging:

In 2014 there were 31 non-employer firms (a 41\% increase from 2006) and annual receipts totaled $\$ 2.5$ million (a 104\% increase from 2006 in real terms). There were 108 employer establishments (a 4\% decrease from 2006) in 2014. These establishments employed approximately 9,115 workers (a 33\% increase from 2006) and had a total annual payroll of $\$ 337$ million (a 20\% increase from 2006 in real terms).

Seafood Sales, Retail: In 2014 there were 17 nonemployer firms (a $42 \%$ increase from 2006) and annual receipts totaled $\$ 1.5$ million (a $107 \%$ increase from 2006 in real terms).

There were 14 employer establishments (a 100\% increase from 2006) in 2014. These establishments had a total annual payroll of $\$ 2.7$ million. Data on the number of employees were suppressed for confidentiality purposes for this section.

Seafood Sales, Wholesale: There were 43
establishments (a 44\% decrease from 2006) in 2014. These establishments employed 120 workers (a 46\% decrease from 2006) and had a total annual payroll of $\$ 7$ million (a 28\% decrease from 2006 in real terms).

## Transport, Support, and Marine Operations

Data for the Transport, Support, and Marine Operations sector of Alaska's economy were largely suppressed for confidentiality reasons. It is clear, however, that these sectors play an important role in the regional economy. For example, the Coastal and Great Lakes Freight Transportation sector accounted for $\$ 89$ million in payroll in 2014.

## North Pacific Region

## MANAGEMENT CONTEXT

The North Pacific Region includes the fisheries in the Exclusive Economic Zone (EEZ) off the state of Alaska. Federal fisheries in this region are managed by the North Pacific Fishery Management Council (NPFMC) and NOAA Fisheries under six fishery management plans (FMPs).

## North Pacific Region FMPs

- Bering Sea/ Aleutian Islands (BSAI) groundfish
- Gulf of Alaska (GOA) groundfish
- BSAI king and tanner crabs
- Alaska scallop
- Salmon in the EEZ
- Arctic

Of the stocks or stock complexes covered in these FMPs, only the blue king crab-Pribilof Islands stock is listed as overfished. No stocks or stock complexes in this region are subject to overfishing.

## Catch Share Programs

The North Pacific Region has six catch share programs, more than any other region. These are the: 1) Western Alaska Community Development Quota (CDQ) Program; 2) Alaska Halibut and Sablefish Individual Fishing Quota (IFQ) Program; 3) American Fisheries Act (AFA) Pollock Cooperatives; 4) Bering Sea and Aleutian Islands (BSAI) Crab Rationalization Program; 5) Bering Sea and Aleutian Islands (BSAI) Non-Pollock Trawl Catcher/ Processor Groundfish Cooperatives (Amendment 80); and 6) Central Gulf of Alaska Rockfish Program. The landings revenues for these programs totaled \$981.9 million in 2014, exceeding the total landings revenue of any other state. Following are descriptions of these catch share programs and their performance.

## Western Alaska Community Development

 Quota (CDQ) Program: The program was originally implemented in 1992 as part of a restructuring of the BSAI groundfish fishery. Under this program, a percentage of the total allowable catch for groundfish, prohibited species, halibut, and crab is apportioned to 65 eligible villages in Western Alaska that are organized into six CDQ groups. The program has the following goals: 1) Provide eligible Western Alaska villages withthe opportunity to participate and invest in fisheries in the Bering Sea and Aleutian Islands Management Area; 2) Support economic development in Western Alaska; 3) Alleviate poverty and provide economic and social benefits to residents; and 4) Achieve a sustainable and diversified local economy.

Alaska Halibut and Sablefish IFQ Program: The program was implemented in 1995. The primary objectives of this IFQ program include the following: 1) Eliminate gear conflicts; 2) Address safety concerns; and 3) Improve product quality. The performance results of the halibut fishery show that, relative to its baseline period (3-year period prior to implementation), the following indicators decreased: 2014 quota, landings, and active vessels. However, inflation-adjusted halibut revenue and revenue per vessel increased. The 2014 performance results for the sablefish fishery show that quota, landings, inflationadjusted revenue, and number of active vessels decreased, while inflation-adjusted revenue per vessel increased.

## American Fisheries Act (AFA) Pollock

Cooperatives: The program was established in 1999 and 2000 with the goals of settling allocation disputes between inshore (catcher vessels), offshore (catcher/processors), and mothership sectors and ending the race for fish. Key performance indicators of this program show that relative to its baseline, the 2014 quota, landings, inflation-adjusted revenue, and revenue per vessel increased. However, the number of active vessels decreased.

## Bering Sea and Aleutian Islands (BSAI) Crab Rationalization Program: The program was

 implemented for the 2005-2006 crab fishing season to address the race to harvest; high bycatch and discard mortality; and product quality issues. The program also aims to balance the interests of those who depend on crab fisheries. This program includes share allocations to harvesters and processors. Processor quota was incorporated to preserve the viability of processing facilities in dependent communities and, particularly, to maintain competitive conditions in ex-vessel markets. The CDQ and Adak Community allocations, regionallandings and processing requirements, and several community protection measures protect community interests. The key 2014 performance indicators of this program show that, relative to its baseline, the quota, landings, and number of active vessels decreased. However, inflation-adjusted revenue and revenue per active vessel increased.

## BSAI Non-Pollock Trawl Catcher/Processor

 Groundfish Cooperatives: The program, commonly referred to as the Amendment 80 Program, was implemented in 2008 to create economic incentives that would improve retention of all fish caught. The cooperatives also seek to reduce bycatch by commercial fishing vessels using trawl gear in the non-pollock groundfish fisheries. Key 2014 performance indicators of this program show that, relative to its baseline, quota, landings, and inflation-adjusted revenue per vessel increased. However, the number of active vessels and inflation-adjusted revenue declined.Central Gulf of Alaska Rockfish Program: The program was initially established as a 2-year (20072008) pilot program by the U.S. Congress and was later extended to 5 years. NOAA Fisheries implemented this catch share program in 2012. The objectives of this program are to reduce bycatch and discards, encourage conservation-minded practices, improve product quality and value, and provide stability to the processing labor force. Results show that in 2014, the quota, landings, number of active vessels, inflation-adjusted revenue, and revenue per active vessel increased relative to the baseline.

## Policy Updates

Salmon bycatch in the Bering Sea pollock fishery is an important management challenge in the North Pacific. On one hand, this challenge involves the largest fishery in the United States with approximately 25\% of total landings. On the other hand, salmon, especially Chinook in Western Alaska rivers, is arguably the most important subsistence fishery in the United States. Prior to 2011, fixed salmon time-area closures and dynamic "rolling hot spot" closures were used to protect salmon. However, the council concluded that these measures were not reducing bycatch sufficiently. In 2011,

Amendment 91 to the BSAI Fishery Management Plan established Chinook catch limits ("hard caps") that were allocated at the cooperative and vessel level. These and other vessel-level incentives were implemented to encourage bycatch reduction at lower levels of salmon encounters and abundance when the hard cap might not strongly constrain the fishery. In 2015, the council passed additional measures to reduce Chinook and chum bycatch, including penalties for vessels with high bycatch rates, salmon excluder device requirements, seasonal reallocation of pollock quota, and hard cap reductions in years of low Chinook in-river abundance.

In June 2015, the NPFMC also recommended the reduction of halibut bycatch limits in the BSAI groundfish fisheries. The bycatch limits were reduced $21 \%$, from 4,426 metric tons to 3,515 metric tons. The new limits were apportioned among sector and gear types and different reductions were applied to each. The Gulf of Alaska halibut bycatch limits incorporate measures to minimize adverse economic impacts on fishing industry sectors and will be phased in during a 3-year period that started in 2014.

Also in 2015, NOAA Fisheries proposed regulations to implement a cost-recovery fee program for the Western Alaska CDQ Program for groundfish and three limited access privilege programs (LAPPs; AFA, Aleutian Islands Pollock, and Amendment 80 fisheries). The cost-recovery fees will make up for the actual costs directly related to the management, data collection efforts, and enforcement of the programs. However, the fees cannot exceed 3\% of the annual ex-vessel value of fish harvested by a program that is subject to the cost-recovery fee. The cost-recovery programs were subsequently implemented in February 2016.

## COMMERCIAL FISHERIES

In this report, commercial fisheries refer to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fishermen. It also excludes the for hire sector, which earns its revenue from selling recreational fishing trips to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and ex-vessel prices of key species/species groups.

## Key North Pacific Commercial Species

- Atka mackerel
- Pacific herring
- Crab
- Flatfish
- Pacific cod
- Pacific halibut
- Rockfish
- Sablefish
- Salmon
- Walleye pollock

The North Pacific groundfish fishery is different from most other United States fisheries in that a large portion of the fishery is processed at sea and, therefore, no landings revenues are reported. The landings revenue for the species landed and processed at sea is estimated by using prices obtained from the shore-side sector. These species include Atka mackerel, flatfish, Pacific cod, rockfish, sablefish, and walleye pollock. When data from the shore-side sector are inadequate, historical information about the relationship between the ex-vessel price and the wholesale price of finished products is used to estimate ex-vessel prices and revenue for portions of the fishery mostly processed at sea.

In this report, the United States seafood industry includes the commercial harvest sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers.

## Economic Impacts

The premise behind economic impact modeling is that every dollar spent in a regional economy (direct impact) is either saved or respent on additional goods or services. If those dollars are respent on other goods and services in the regional economy, this spending generates additional economic activity in the region. This report provides estimates of total economic impacts for the Nation and for each of the 23 coastal states. Total economic impacts for each state and the Nation represent the sum of direct impacts; indirect impacts (in this case, the impact from suppliers to the seafood industry); and induced impacts (spending by employees on personal and household expenditures, where employees of both seafood businesses and its full supply chain are included). That is, impacts from the seafood industry as well as the economic activity generated throughout each region's broader economy from this industry.

Four different measures are commonly used to show commercial fisheries landings affect the economy in a region (state or nationwide): sales, income, valueadded, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as commercial fishing. It includes both the direct sales of fish landed and sales made between businesses and households resulting from the original sale. Income includes personal income (wages and salaries) and proprietors' income (income from selfemployment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported directly or indirectly by the sales of seafood or purchases of inputs to commercial fishing. The first three types of measures are calculated in terms of dollars, whereas employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. The United States seafood industry is defined here as the commercial fishing sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers. ${ }^{1}$

In 2015, Alaska's commercial fishing and seafood industry generated $\$ 4.4$ billion in sales impacts, $\$ 1.9$ billion in income impacts, $\$ 2.4$ billion in value-added impacts, and 53,400 full- and part-time jobs. The commercial harvesters sector generated the largest employment impacts across sectors with 38,000 jobs. The commercial harvesters sector generated the largest sales impacts ( $\$ 3.1$ billion), the largest income impacts ( $\$ 1.3$ billion), and the largest value-added impacts ( $\$ 1.6$ billion).

## Landings Trends

While total landings revenue were unchanged from 2014, at the species/species group level there was considerable variation. Most notably salmon landings revenue was down $\$ 133$ million (24\%) from 2014 levels despite records landings, which almost doubled from 2014 levels. Market reports attributed landings revenue declines to a strong dollar, which weakened demand in Japan and the European Union (EU), as well as the Russian import ban on food products from the US, Canada, Norway and the EU. Surging supplies of pink salmon (up 95\%), which is consistent with the biennial cycle of pink salmon runs, and chum salmon

[^15]
## Landings Revenue: Largest Increases

From 2006:

- Crab (157\%, 122\% in real terms)
- Atka mackerel (106\%, 78\% in real terms)
- Rockfish (62\%, $40 \%$ in real terms)

From 2014:

- Crab (157\%, 122\% in real terms)
- Atka mackerel (106\%, 78\% in real terms)
- Rockfish (62\%, $40 \%$ in real terms)

## Landings Revenue: Largest Decreases

From 2006:

- Pacific halibut ( $-43 \%,-50 \%$ in real terms)
- Pacific herring ( $-6 \%,-18 \%$ in real terms)

From 2014:

- Pacific herring (-39\%)
- Salmon (-24\%)
- Flatfish (-23\%)
(up 49\%) coupled with significant increases in sockeye salmon landings (up 18\%) in an already weak market only served to further dampen prices. With the Russia ban also covering farmed salmon, the market for wild caught salmon faced further pressure from that source. The USDA purchase of $\$ 30$ million of canned sockeye salmon helped reduce inventories but was not sufficient to prevent sockeye prices falling from $\$ 1.39$ per pound in 2014 to \$0.69 in 2015.

Pacific herring landings revenue was down 39\% (\$4.5 million) during this period. A soft market, in part due to the Russia import ban, had an effect on both landings and price. In addition, a reduction in the harvest limit for the Sitka Sound sac roe fishery of almost $50 \%$ (7,600 tons) also contributed to the decline in landings revenue.

After adjusting for inflation, crab landings revenue ( $\$ 284$ million) was at its highest level since 1999. Southern tanner crab landings revenue ( $\$ 41$ million) increased $\$ 20$ million from 2014; snow crab landings revenue ( $\$ 133$ million) was up $\$ 18$ million; and king crab ( $\$ 99$ million) was up $\$ 13$ million. Only dungeness crab landings revenue fell relative to 2014, which had been a somewhat anomalous year for that species that included near record high prices (second highest on

## Landings: Largest Increases

From 2006:

- Rockfish (90\%)
- Crab (76\%)
- Salmon (64\%)

From 2014:

- Atka mackerel (69\%)
- Salmon (52\%)
- Crab (42\%)

## Landings: Largest Decreases

From 2006:

- Pacific halibut (-67\%)
- Sablefish (-33\%)
- Pacific herring (-14\%)

From 2014:

- Pacific herring (-29\%)
- Flatfish (-23\%)
- Sablefish (-7\%)
record after adjusting for inflation) and landings that exceeded the most recent $5-y e a r$ average by $51 \%$.

Walleye pollock landings revenue (\$509 million), up $21 \%$ or $\$ 87$ million from 2014, was also a bright spot for 2015. An uptick in landings revenue largely attributable to the $3.39 \%$ increase in the BSAI TAC and slightly higher prices drove pollock landings revenue up. Also noteworthy in 2015, the legal market name of "Alaska pollock" was changed to "pollock." This change prevents pollock caught elsewhere such as in Russia from being labeled "Alaska pollock" and thus provides greater clarity to consumers on where their seafood was harvested.

## Landings Revenue

In 2015, landings revenue totaled about $\$ 1.7$ billion, a $32 \%$ increase from 2006 (a 25\% increase in real terms after adjusting for inflation) and remained unchanged from 2014. Finfish landings revenue accounted for $83 \%$ of all landings revenue. In 2015, walleye pollock (\$509 million), salmon ( $\$ 413$ million), and crab ( $\$ 284$ million) dominated landings revenue. From 2006 to 2015, crab (157\%, 122\% in real terms); Atka mackerel (106\%, $78 \%$ in real terms); and rockfish (62\%, $40 \%$ in real terms) had the largest revenue increases, while Pacific halibut ( $-43 \%,-50 \%$ in real terms) and Pacific herring
(-6\%, $-18 \%$ in real terms) had the largest decreases. From 2014 to 2015, Atka mackerel (23\%), walleye pollock (21\%), and crab (20\%) had the largest revenue increases, while Pacific herring (-39\%), salmon (-24\%), and flatfish ( $-23 \%$ ) had the largest decreases.

## Landings

In 2015, commercial fishermen in the North Pacific Region landed more than 6 billion pounds of finfish and shellfish, an 11\% increase from 2006 and a 6\% increase from 2014. Walleye pollock contributed the most to landings, accounting for $54 \%$ of total volume. From 2006 to 2015, rockfish (90\%), crab (76\%), and salmon (64\%) had the largest landings increases, while Pacific halibut (-67\%), sablefish (-33\%), and Pacific herring ( $-14 \%$ ) had the largest decreases. From 2014 to 2015, Atka mackerel (69\%), salmon (52\%), and crab (42\%) had the largest landings increases, while Pacific herring (-29\%), flatfish (-23\%), and sablefish (-7\%) had the largest decreases.

## Price

In 2015, Pacific halibut ( $\$ 4.85$ per pound) received the highest ex-vessel price in the North Pacific Region. Landings of Pacific herring ( $\$ 0.1$ per pound) had the lowest ex-vessel price. From 2006 to 2015, Atka mackerel (129\%, $98 \%$ in real terms); Pacific halibut ( $74 \%, 50 \%$ in real terms); and sablefish (52\%, 32\% in real terms) had the largest price increases, while flatfish ( $-24 \%,-35 \%$ in real terms); rockfish ( $-15 \%,-26 \%$ in real terms); and Pacific cod ( $-10 \%,-22 \%$ in real terms) had the largest decreases. From 2104 to 2015, walleye pollock (16\%), Pacific cod (16\%), and sablefish (7\%) had the largest price increases, while salmon (-50\%), Atka mackerel (-27\%), and crab (-16\%) had the largest decreases.

## RECREATIONAL FISHERIES

In this report, recreational fisheries refer to fishing for fun rather than to resell fish (commercial fishing) or for subsistence. The recreational fisheries section reports on economic impacts and expenditures, angler participation, trips, and catch of key species/species groups.

## Key North Pacific Recreational Species

- Chinook salmon
- Pacific halibut
- Chum salmon - Pink salmon
- Coho salmon - Razor clams
- Greenlings • Rockfish
(lingcod)
- Sockeye salmon

## Economic Impacts and Expenditures

The contribution of recreational fishing activities ${ }^{2}$ in the United States are reported in terms of economic impacts from angler expenditures. Total annual trip expenditures are estimated by multiplying mean trip expenditures by the estimated number of adult trips in each trip mode (for-hire, private boat, and shore). Total annual durable expenditures are estimated by multiplying mean durable expenditures by the estimated annual number of adult participants in a given state.

Four different measures are commonly used to show how angler expenditures affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as recreational fishing. It includes both the direct sales made by the angler and sales made between businesses and households resulting from that original sale by the angler. Income includes personal income (wages and salaries) and proprietors' income (income from selfemployment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full- and part-time jobs supported directly or indirectly by the purchases made by anglers. The first three measures are calculated in terms of dollars, whereas employment impacts are measured in terms of number of jobs. Note that these categories are not additive. NOAA Fisheries uses a regional impact modeling software, called IMPLAN, to estimate these four types of impacts.

Economic impacts from recreational fishing activities in Alaska totaled 5,407 jobs in 2015 and generated \$619 million in sales, \$223 million in income, and \$362 million in value-added impacts. Impacts from durable

[^16]equipment expenditures (e.g., rods and reels, fishingrelated equipment, boats, vehicles, and second homes) accounted for $29 \%$ of employment, $19 \%$ of sales, $21 \%$ of income, and $20 \%$ of value-added impacts. Of the three fishing trip modes, trips in the for-hire mode had the greatest economic impact, accounting for $37 \%$ of employment impacts.

Expenditures for fishing trips and durable equipment across Alaska in 2015 totaled more than $\$ 469$ million. Approximately $\$ 347$ million of these expenditures were related to trip expenses, with a large portion coming from trips in the private boat (48\%) and for-hire (47\%) sectors. In 2015, durable goods expenditures were more than $\$ 122$ million, with the largest portion coming from boat expenses ( $\$ 57$ million).

## Days Fished

The state of Alaska records recreational fishing effort in terms of the number of days fished rather than the number of fishing trips. Anglers who fished in Alaska spent approximately 975,000 days fishing in 2015. ${ }^{3}$ This number was a $4 \%$ increase from the days spent fishing in 2006. From 2014 to 2015, there was a $2 \%$ increase in the number of days fished.

## Participation

In 2015, 309,000 recreational saltwater anglers fished in Alaska. This number was a 3\% decrease from 2006 and an 8\% increase from 2014. These anglers are categorized as either residents of coastal/non-coastal counties (41\%) or out-of-state anglers (59\%).

## Harvest and Release

Of Alaska's key species and species groups, Pacific halibut (691,000 fish), coho salmon (578,000 fish), and rockfish species (475,000 fish) were most frequently caught by recreational anglers. From 2006 to 2015, sockeye salmon (50\%), rockfish species (41\%), and pink salmon (35\%) had the largest increases in catch, while razor clams (-92\%), lingcod (-38\%), and chum salmon (-21\%) had the largest decreases. From 2014 to 2015, pink salmon (68\%), coho salmon (28\%), and chum salmon (23\%) had the largest increases in catch, while razor clams (-58\%), sockeye salmon (-11\%), and lingcod (-10\%) had the largest decreases.

## Recreational Catch: Largest Increases

From 2006:

- Sockeye salmon (50\%)
- Rockfish species (41\%)
- Pink salmon (35\%)

From 2014:

- Pink salmon (68\%)
- Coho salmon (28\%)
- Chum salmon (23\%)

## Recreational Catch: Largest Decreases

From 2006:

- Razor clams (-92\%)
- Lingcod (-38\%)
- Chum salmon (-21\%)

From 2014:

- Razor clams (-58\%)
- Sockeye salmon (-11\%)
- Lingcod (-10\%)

## MARINE ECONOMY

For this report, the marine economy refers to the economic activity generated by fishing and marinerelated industries in a coastal state. The state marine economy consists of two industry sectors: 1) seafood sales and processing (employer establishments and non-employer firms); and 2) transport, support, and marine operations (employer establishments). These sectors include several different marine-related industries. ${ }^{4,5}$

To measure the size of the commercial fishing sector in a state's economy relative to the size of the commercial fishing sector in the national economy ${ }^{6}$, researchers use an index called the Commercial Fishing Location Quotient (CFLQ). The CFLQ is calculated as the ratio of the percentage of regional employment in the commercial fishing sector relative to the percentage of national employment in the commercial fishing sector. The U.S. CFLQ is 1 . If a state's CFLQ is less than 1 , then less commercial fishing occurs in this state than the national average. If a state's CFLQ is greater than 1, then more commercial fishing occurs in this state than the national average. The Bureau of Labor Statistics did not disclose CFLQ data for Alaska for 2014.

[^17]In 2014, 21,000 establishments operated throughout Alaska, including marine and non-marine-related establishments. These establishments employed 267,000 workers and had a total annual payroll of more than $\$ 15$ billion. The region's gross domestic product was approximately \$57 billion in 2014.

## Seafood Sales and Processing

## Seafood Product Preparation and Packaging:

In 2014 there were 31 non-employer firms (a 41\% increase from 2006) and annual receipts totaled $\$ 2.5$ million (a 104\% increase from 2006 in real terms). There were 108 employer establishments (a 4\% decrease from 2006) in 2014. These establishments employed approximately 9,115 workers (a 33\% increase from 2006) and had a total annual payroll of $\$ 337$ million (a 20\% increase from 2006 in real terms).

Seafood Sales, Retail: In 2014 there were 17 nonemployer firms (a $42 \%$ increase from 2006) and annual receipts totaled $\$ 1.5$ million (a $107 \%$ increase from 2006 in real terms).

There were 14 employer establishments (a 100\% increase from 2006) in 2014. These establishments had a total annual payroll of $\$ 2.7$ million. Data on the number of employees were suppressed for confidentiality purposes for this section.

Seafood Sales, Wholesale: There were 43
establishments (a 44\% decrease from 2006) in 2014. These establishments employed 120 workers (a 46\% decrease from 2006) and had a total annual payroll of $\$ 7$ million (a 28\% decrease from 2006 in real terms).

## Transport, Support, and Marine Operations

Data for the Transport, Support, and Marine Operations sector of Alaska's economy were largely suppressed for confidentiality reasons. It is clear, however, that these sectors play an important role in the regional economy. For example, the Coastal and Great Lakes Freight Transportation sector accounted for $\$ 89$ million in payroll in 2014.

## Tables | Alaska

Alaska | Commercial Fisheries

|  | With Imports |  |  |  | Without Imports |  |  |  |

[^19]
## Pacific Region

- California
- Oregon - Washington

## MANAGEMENT CONTEXT

The Pacific Region includes California, Oregon, and Washington. Federal fisheries in this region are managed by the Pacific Fishery Management Council (PFMC) and NOAA Fisheries under four fishery management plans (FMPs).

## Pacific Region FMPs

- Coastal pelagic species
- Pacific coast salmon
- Pacific coast groundfish
- West Coast highly migratory species

Three of the stocks or stock complexes covered in these FMPs were listed as overfished in 2015: Pacific ocean perch, yelloweye rockfish, and Pacific bluefin tuna. Seven stock complexes were subject to overfishing in 2015: Chinook salmon (three stocks), coho salmon, Pacific bluefin tuna, bigeye tuna, and swordfish.

Conservative management techniques are employed in the Pacific Region's fisheries. For example, the Pacific groundfish and salmon fisheries are subject to "weak stock management" where access to the surplus of healthier stocks that can be harvested is often restricted to protect weaker stocks with which they comingle in the ocean. These weaker stocks include seven rebuilding groundfish stocks, salmon (listed under the Endangered Species Act), and other non-listed stocks that constrain the fishery.

Salmon management is further complicated by the need to ensure equal allocation of harvest among diverse user groups and coordination with other entities that have jurisdiction over various aspects of salmon management. Decades of habitat modification, hatchery practices, harvest, and growing competition for water have affected the viability of salmon stocks and made them more vulnerable to adverse environmental conditions. These conditions include the prolonged drought and adverse ocean conditions experienced in recent years. Low returns of salmon to the Klamath River in 2006, and to the Sacramento River in 2008 and 2009, resulted in unprecedented closures of ocean and in-river fisheries, leading to federal disaster relief for affected entities.

Coastal pelagic species (CPS) are highly variable,
environmentally sensitive stocks that provide food for marine mammals, birds, and fish. These species include Pacific sardine, northern anchovy, Pacific and jack mackerel, and market squid. Of these species, Pacific sardine is the most commonly targeted CPS finfish and is managed according to an innovative harvest control rule: Allowable harvest varies with sea surface temperature. Because the geographic range of sardine tends to expand with abundance, harvest allocation between the California and Pacific Northwest fisheries is an ongoing and dynamic issue. The annual guideline for sardine harvest is allocated coast-wide on a seasonal basis. Recent decreases in harvest guideline limits have contributed to the development of an intense derby fishery.

Catch limits for Pacific halibut, a transboundary fish stock, are set in January by the International Pacific Halibut Commission (IPHC). This bilateral commission between the United States and Canada determines total allowable catch levels (TACs) for Pacific halibut that will be caught in the United States and Canadian exclusive economic zones (EEZs). After catch levels are determined, the PFMC develops a catch-sharing plan for tribal and non-tribal (i.e., commercial and recreational) fisheries in the federal waters of California, Oregon, and Washington. Pacific Halibut is targeted only with hook gear, but there are allocations to the trawl sector for bycatch, including individual bycatch quotas, in the Pacific groundfish trawl IFQ.

The Highly Migratory Species (HMS) FMP includes tunas, billfish, and pelagic sharks as managed species. The albacore surface hook-and-line fishery is by far the most economically important commercial HMS fishery, followed by the drift gillnet fishery for swordfish and thresher shark. HMS is also a very important component of the catch for the Pacific Region's commercial passenger fishing vessel fleet and the private recreational boat fleet.

## Catch Share Programs

The Pacific Region has two catch share programs: 1) the Pacific Sablefish Permit Stacking Program; and 2) the Pacific Groundfish Trawl Rationalization Program. The landings revenues for these programs totaled more than $\$ 58.3$ million in 2014 . Following are descriptions of these catch share programs and their performance.

Pacific Sablefish Permit Stacking Program: This program was implemented in 2001 and allows vessels to stack multiple vessel permits on a single vessel. The goal of this approach is to improve economic efficiency through rationalization of the fixed gear fleet, increase benefits for fishing communities, promote equity, lessen reallocation effects of previous harvest regulations, promote safety, and improve product quality and value. Results for this program show that in 2014, the number of active vessels and landings decreased compared with the baseline period (average of the 3-year period prior to the start of the program). However, inflation-adjusted revenue and inflation-adjusted revenue per vessel increased during 2014.

Pacific Trawl Rationalization Program: This program was implemented by the PFMC in January 2011. This program involves individual fishing quotas (IFQs) for non-whiting groundfish and whiting trawlers delivering to shoreside plants, and cooperatives for whiting mothership and catcher processor sectors. The objectives of this program are to provide a mechanism for total catch accounting; provide a viable, profitable, and efficient groundfish fishery; promote practices that reduce bycatch and discard mortality, and minimize ecological impacts; increase operational flexibility; minimize adverse effects from the IFQ program on fishing communities and other fisheries; promote measurable economic and employment benefits through the seafood catching, processing, distribution, and support sectors of the industry; provide quality product for the consumer; and increase safety in the fishery.

The economic performance of the program has been strong. Net revenue per active catcher vessel increased $65 \%$ relative to the pre-catch share period (2009-2010) for the non-whiting groundfish fishery, and $400 \%$ for the whiting fishery. Meanwhile, motherships experienced a 62\% increase and catcher-processors experienced a $7 \%$ decrease in net revenue. Results for this program show that in 2014, inflation-adjusted revenue and landings increased compared to the baseline period. However, the number of active vessels decreased during this period. Expanded observer coverage and dockside monitoring, which were implemented with the catch share program, coupled with long-term adherence to catch targets and
improved stock assessment models have also contributed, to varying degrees, to improved fishery performance. For example, in the first 3 years of catch shares, the total catch of rebuilding stocks (of which two-canary rockfish and petrale sole-are now declared rebuilt) was $50 \%$ lower than the previous 3 years.

## Policy Updates

In April 2015, after reviewing the best available science and hearing from fishery participants and environmental groups, the PFMC closed the Pacific sardine fishery for the 2015-2016 season. The fishery was scheduled to open on July 1, 2015, but the biomass was estimated to fall well below the 150,000 metric ton threshold for a directed fishery. Although commercial fishing is closed, the PFMC allowed up to 7,000 tons of sardine to be harvested to account for small amounts taken as incidental catch in other fisheries, live bait harvest, tribal harvest, and research. Only days after closing the 2015-16 season, the NMFS and the PFMC closed the 2014-15 fishery early because the harvest forecast indicated the fishery would reach its harvest allocation prior to the end of the fishing season (June 30). Since 2006 Pacific sardine biomass, which is prone to significant natural fluctuation due to large-scale changes in oceanic temperature, has declined $90 \%$ from approximately1 million metric tons in 2006 to 97,000 metric tons in 2015.

The U.S. pelagic longline fishery for bigeye tuna was temporarily shut down in August 2015 for vessels 24 meters in overall length in the eastern Pacific Ocean (EPO) through December 31, 2015, because the 2015 catch limit of 500 metric tons was expected to be reached.

Closures and delays in the Pacific crab and razor clam fisheries in 2015 were due to elevated levels of domoic acid, a naturally occurring bio-toxin produced by marine algae of the genus Psuedo-nitzschia. A massive pool of warm water, termed "the blob" by scientists, in the Pacific Ocean coupled with El Nino contributed to higher than average water temperatures that brought on the harmful algal bloom. Unsafe levels of domoic acid shut down razor clam fisheries in both Oregon and Washington in May 2015 followed by the June closure of Washington's recreational and commercial dungeness crab fisheries. In November, California delayed the start of its recreational and
commercial dungeness crab and rock crab fisheries when testing revealed unsafe levels of domoic acid. Oregon and Washington also delayed the start of its 2015-16 dungeness crab season in November due to unsafe domoic acid levels.

In June 2015, the PFMC announced that two important West Coast groundfish stocks-canary rockfish and petrale sole-were rebuilt. These stocks had been subject to strict rebuilding plans that severely constrained West Coast fisheries for more than a decade. The canary rockfish was declared overfished in 2000, and a rebuilding plan was put in place in 2001. Under the rebuilding plan, catch quotas were dramatically reduced and large area closures put in place, and the stock was expected to rebuild by 2057. However, the new 2015 canary rockfish assessment showed that the coast-wide canary stock is already rebuilt. Petrale sole was declared overfished in 2010, and a rebuilding plan was put in place in 2011 to rebuild the stock by 2016. The petrale sole harvest limit was cut by half; fisheries in which petrale sole could be caught were reduced. Area closures were also implemented. The 2015 stock assessment showed that the rebuilding plan was successful and the stock had increased over the target level.

In November 2015, the council discussed management of the swordfish drift gillnet fishery. The Council reiterated its recommendation to NOAA Fisheries to issue an exempted fishing permit (EFP) to test the use of modified large-mesh drift gillnet gear for fishing by two boats inside the Pacific Leatherback Conservation Area. Fishing would occur when and where bycatch was likely to be low and swordfish abundance high. The EFP tested generally whether "ecoset triggered fishing" could result in substantially higher swordfish catch with far less bycatch. Four exempted fishing permit EFP applications were submitted for council consideration in November.

## COMMERCIAL FISHERIES

In this report, commercial fisheries refer to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fishermen. It also excludes the for hire sector, which earns its revenue from selling recreational fishing trips
to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and ex-vessel prices of key species/species groups.

## Key Pacific Region Commercial Species

- Albacore tuna
- Rockfish
- Crab
- Sablefish
- Flatfish
- Salmon
- Hake
- Shrimp
- Other shellfish
- Squid

## Economic Impacts

The premise behind economic impact modeling is that every dollar spent in a regional economy (direct impact) is either saved or respent on additional goods or services. If those dollars are respent on other goods and services in the regional economy, this spending generates additional economic activity in the region. This report provides estimates of total economic impacts for the Nation and for each of the 23 coastal states. Total economic impacts for each state and the Nation represent the sum of direct impacts; indirect impacts (in this case, the impact from suppliers to the seafood industry); and induced impacts (spending by employees on personal and household expenditures, where employees of both seafood businesses and its full supply chain are included). That is, impacts from the seafood industry as well as the economic activity generated throughout each region's broader economy from this industry.

Four different measures are commonly used to show commercial fisheries landings affect the economy in a region (state or nationwide): sales, income, valueadded, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as commercial fishing. It includes both the direct sales of fish landed and sales made between businesses and households resulting from the original sale. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported directly or indirectly by the sales of seafood or purchases of inputs to commercial fishing. The first three types of

## Landings Revenue: Largest Increases

From 2006:

- Shrimp (604\%, 508\% in real terms)
- Rockfish (56\%, 34\% in real terms)
- Salmon (38\%, 20\% in real terms)

From 2014:

- Shrimp (43\%)
- Sablefish (19\%)
- Rockfish (7\%)

## Landings Revenue: Largest Decreases

From 2006:

- Hake ( $-30 \%,-41 \%$ in real terms)
- Crab ( $-27 \%,-37 \%$ in real terms)
- Squid (-9\%, $-22 \%$ in real terms)

From 2014:

- Squid (-66\%)
- Hake (-59\%)
- Crab (-47\%)
measures are calculated in terms of dollars, whereas employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. The United States seafood industry is defined here as the commercial fishing sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers. ${ }^{1}$

In 2015, commercial fishing in California generated the largest employment impacts in the region with 113,900 jobs. California also had the largest income impacts (\$4.5 billion), sales impacts ( $\$ 21.3$ billion), and value-added impacts (\$7.6 billion).

The importers sector in California generated the highest employment impacts of any state-level sector with 52,600 jobs. The importers sector in California generated the highest state-level income impacts (\$2.6 billion), the highest state-level sales impacts (\$16.3 billion), and the highest state-level value-added impacts in the region ( $\$ 5$ billion).

## Landings Trends

Landings revenue declined in all three states (California, -49\%; Oregon, -28\% and Washington, -9\%) from 2014-2015. Crab landings revenue had significant

## Landings: Largest Increases

From 2006:

- Shrimp (419\%)
- Rockfish (86\%)

From 2014:

- Sablefish (18\%)
- Shrimp (13\%)
- Rockfish (11\%)

## Landings: Largest Decreases

From 2006:

- Crab (-73\%)
- Hake (-40\%)
- Other shellfish (-38\%)

From 2014:

- $\quad$ Squid ( $-65 \%$ )
- Crab (-56\%)
- Hake (-42\%)
declines in all three states from 2014-2015 due to the marine toxin closures, which sharply reduced landings. Crab landings revenue fell $\$ 50$ million ( $-71 \%$ ) in California; $\$ 36$ million ( $-75 \%$ ) in Oregon; and $\$ 8$ million (-10\%) in Washington. Pacific sardine landings revenue was down significantly in California (-83\%, $\$ 2$ million) and Oregon ( $-77 \%$, $\$ 3$ million) for this period due fishery closures based on low stock abundance; lower sardine prices in both states also negatively impacted landings revenues.

Squid, which had been California's largest fishery by value and volume in 2014, fell $\$ 48$ million ( $-66 \%$ ) in 2015 due to the large decline in landings ( 148 million pounds, $-65 \%$ ). The $\$ 50$ million and $\$ 48$ million declines in California landings revenue of crab and squid accounted for almost 80\% of the state's overall decline in landings revenue from 2014-15.

Sharply lower landings and landings revenue of hake and salmon, major fisheries in both Oregon and Washington, may have been attributed to the "warm blob" effects. Hake landings revenues in 2015 were down $\$ 11$ million ( $-61 \%$ ) in Oregon, down $\$ 3$ million (-53\%) in Washington from 2014 levels, and down \$21 million for at sea processors (-59\%); salmon landings

[^20]revenue fell $\$ 8$ million ( $-41 \%$ ) in Oregon and $\$ 11$ million (-28\%) in Washington from 2014 levels.

Sablefish and shrimp landings revenue were the two bright spots for Oregon fishermen in 2015. Landings revenues were up $\$ 5$ million and $\$ 11$ million, respectively, from 2014 levels driven by both higher landings and higher prices. In Washington, 2015 shrimp landings revenue were also up from 2014 levels, increasing \$13 million (68\%) from 2014 levels.

## Landings Revenue

Landings revenue in the Pacific Region totaled \$558 million in 2015. This number represented a $18 \%$ increase from 2006 (a $2 \%$ increase in real terms after adjusting for inflation) and a $28 \%$ decrease from 2014. Landings revenue was highest in Washington ( $\$ 300$ million), followed by California ( $\$ 129$ million). Shellfish landings revenue made up 65\% of total revenue. Other shellfish ( $\$ 137$ million) and crab ( $\$ 105$ million) had the highest landings revenue in the Pacific Region in 2015. Together they accounted for 45\% of total landings revenue.

From 2006 to 2015, shrimp (604\%, 508\% in real terms); rockfish (56\%, 34\% in real terms); and salmon (38\%, $20 \%$ in real terms) had the largest revenue increases, while hake ( $-30 \%,-41 \%$ in real terms); crab (-27\%, $-37 \%$ in real terms); and squid ( $-9 \%,-22 \%$ in real terms) had the largest decreases. From 2014 to 2015, shrimp (43\%), sablefish (19\%), and rockfish (7\%) had the largest revenue increases, while squid (-66\%), hake ( $-59 \%$ ), and crab ( $-47 \%$ ) had the largest decreases.

## Landings

In 2015, commercial fishermen in the Pacific Region landed 747 million pounds of finfish and shellfish, a $36 \%$ decrease from 2006 and a 38\% decrease from 2014. Landings volume was highest in California (186 million pounds), followed by Washington (154 million pounds). Hake had the highest landings volume in the Pacific Region, accounting for 45\% of landed weight.

From 2006 to 2015, shrimp (419\%) and rockfish (86\%) had the largest landings increases, while crab (-73\%), hake ( $-40 \%$ ), and other shellfish ( $-38 \%$ ) had the largest decreases. From 2014 to 2015, sablefish (18\%), shrimp
(13\%), and rockfish (11\%) had the largest revenue increases, while squid ( $-65 \%$ ), crab ( $-56 \%$ ), and hake ( $-42 \%$ ) had the largest decreases.

## Price

In 2015, other shellfish (\$11.61 per pound) received the highest ex-vessel price in the Pacific Region. Landings of hake ( $\$ 0.08$ per pound) had the lowest ex-vessel price. From 2006 to 2015, crab (174\%, 137\% in real terms); other shellfish ( $101 \%, 74 \%$ in real terms); and salmon ( $57 \%, 35 \%$ in real terms) had the largest price increases, while rockfish (-16\%, $-28 \%$ in real terms); squid ( $21 \%$, $5 \%$ in real terms); and flatfish ( $23 \%, 6 \%$ in real terms) had the largest decreases. From 2014 to 2015, shrimp ( $27 \%$ ) , crab ( $21 \%$ ), and other shellfish (12\%) had the largest price increases, while hake (-29\%), squid (-5\%), and salmon ( $-4 \%$ ) had the largest decreases.

## RECREATIONAL FISHERIES

In this report, recreational fisheries refer to fishing for fun rather than to resell fish (commercial fishing) or for subsistence. The recreational fisheries section reports on economic impacts and expenditures, angler participation, trips, and catch of key species/species groups.

## Key Pacific Region Recreational Species

- Albacore \& other tunas
- Barracuda, bass \& bonito
- Croakers
- Flatfishes
- Greenlings
- Rockfishes \& scorpionfishes
- Salmon
- Sculpins
- Surfperches

## Economic Impacts and Expenditures

The contribution of recreational fishing activities ${ }^{2}$ in the United States is reported in terms of economic impacts from angler expenditures. Total annual trip expenditures are estimated by multiplying mean trip expenditures by the estimated number of adult trips in each trip mode (for-hire, private boat, and shore). Total annual durable expenditures are estimated by multiplying mean durable expenditures by the estimated annual number of adult participants in a given state.

[^21]
## Recreational Catch: Largest Increases

From 2006:

- Albacore and other tunas (179\%)
- Greenlings (60\%)
- Rockfishes and scorpionfishes (44\%)

From 2014:

- Greenlings (8\%)
- Albacore and other tunas (4\%)

## Recreational Catch: Largest Decreases

From 2006:

- Croakers (-77\%)
- Barracuda, bass, and bonito (-30\%)
- Flatfishes (-24\%)

From 2014:

- Flatfishes (-52\%)
- Salmon (-49\%)
- Croakers (-27\%)

Four different measures are commonly used to show how angler expenditures affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as recreational fishing. It includes both the direct sales made by the angler and sales made between businesses and households resulting from that original sale by the angler. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full- and part-time jobs supported directly or indirectly by the purchases made by anglers. The first three measures are calculated in terms of dollars, whereas employment impacts are measured in terms of number of jobs. Note that these categories are not additive. NOAA Fisheries uses a regional impact modeling software, called IMPLAN, to estimate these four types of impacts.

The greatest employment impacts from expenditures on saltwater recreational fishing in the Pacific Region were generated in California (16,500 jobs), followed by Washington (6,500 jobs). The largest sales impacts were observed in California (\$2.1 billion), followed by

Washington (\$775 million). The biggest income impacts were generated in California (\$797 million), followed by Washington (\$297 million). The greatest value-added impacts were in California ( $\$ 1.3$ billion), followed by Washington (\$483 million).

Recreational fishing expenditures (on both fishing trips and durable equipment purchases) across the Pacific Region in 2015 totaled about $\$ 2.5$ billion. Trip expenditures totaled more than $\$ 640$ million, with a large portion coming from trips in the private boat (37\%) and for-hire (33\%) sectors. Durable goods expenditures totaled $\$ 1.8$ billion, with the largest portion coming from boat expenses (\$946 million).

## Fishing Trips

In 2015, recreational anglers took 5.8 million fishing trips in the Pacific Region. This number was a $9 \%$ decrease from 2006 and a 10\% decrease from 2014. The largest proportions of trips were taken in the shore mode (53\%) and private boat mode ( $32 \%$ ). States with the highest number of recorded trips were California ( 3.7 million trips) and Washington ( 1.3 million trips).

## Participation

In 2015, 1.2 million recreational anglers who fished in the Pacific Region. This number was a $32 \%$ decrease from 2006 and a $15 \%$ decrease from 2014. These anglers were Pacific Region residents from either a coastal county (74\%) or non-coastal county (26\%).

## Harvest and Release

Of the Pacific Region's key species and species groups, rockfishes and scorpionfishes ( 4.7 million fish), surfperches ( 2.4 million fish), and barracuda, bass, and bonito ( 1.6 million fish) were most frequently caught by recreational anglers. From 2006 to 2015, albacore and other tunas (179\%), greenlings (60\%), and rockfishes and scorpionfishes (44\%) had the largest increases in catch, while croakers ( $-77 \%$ ), barracuda, bass, and bonito ( $-30 \%$ ), and flatfishes ( $-24 \%$ ) had the largest decreases. From 2014 to 2015, greenlings (8\%) and albacore and other tunas (4\%) had the largest increases in catch, while flatfishes (-52\%), salmon (-49\%), and croakers (-27\%) had the largest decreases.

## MARINE ECONOMY

For this report, the marine economy refers to the economic activity generated by fishing and marinerelated industries in a coastal state. The state marine economy consists of two industry sectors: 1) seafood sales and processing (employer establishments and non-employer firms); and 2) transport, support, and marine operations (employer establishments). These sectors include several different marine-related industries. ${ }^{3,4}$

To measure the size of the commercial fishing sector in a state's economy relative to the size of the commercial fishing sector in the national economy, researchers use an index called the Commercial Fishing Location Quotient (CFLQ). ${ }^{5}$ The CFLQ is calculated as the ratio of the percentage of regional employment in the commercial fishing sector relative to the percentage of national employment in the commercial fishing sector. The U.S. CFLQ is 1 . If a state's CFLQ is less than 1 , then less commercial fishing occurs in this state than the national average. If a state's CFLQ is greater than 1, then more commercial fishing occurs in this state than the national average.

The Bureau of Labor Statistics did not disclose CFLQ data for Washington for 2014. In 2014, the CFLQ for Oregon was the highest for the remaining states in the region at 3.99. Oregon's CFLQ suggests that the level of employment in commercial fishing-related industries in this state is approximately 3.99 times higher than the level of employment in these industries nationwide.

In 2014, 1.2 million establishments operated throughout the Pacific Region (including marine and non-marine-related establishments). These establishments employed 18 million workers and had a total annual payroll of $\$ 1$ trillion. The region's gross domestic product was approximately $\$ 2.9$ trillion.

## Seafood Sales and Processing

Seafood Product Preparation and Packaging: In 2014, there were 226 non-employer firms (a 50\% increase from 2006) and annual receipts totaled $\$ 17$ million (an 18\% increase from 2006 in real terms).

The greatest number of firms was located in California (164).

There were 163 employer establishments (a $1 \%$ decrease from 2006) in 2014. These establishments employed approximately 8,724 workers (a $5 \%$ decrease from 2006) and had a total annual payroll of $\$ 430$ million (a 4\% increase from 2006 in real terms). The greatest number of establishments was located in Washington (90).

Seafood Sales, Retail: In 2014, there were 279 nonemployer firms (a 37\% increase from 2006) and annual receipts totaled $\$ 21$ million (a $20 \%$ decrease from 2006 in real terms). The greatest number of firms was located in California (227).

There were 223 employer establishments (a 13\% decrease from 2006) in 2014. These establishments employed 1,570 workers (a 4\% decrease from 2006) and had a total annual payroll of $\$ 42$ million (a $15 \%$ increase from 2006 in real terms). The greatest number of establishments was located in California (167).

Seafood Sales, Wholesale: There were 482
establishments (a 26\% increase from 2006) in 2014. These establishments employed 5,202 workers (a $2 \%$ increase from 2006) and had a total annual payroll of $\$ 237$ million (a 10\% increase from 2006 in real terms). The greatest number of establishments was located in California (341).

## Transport, Support, and Marine Operations

The size of the Transport, Support, and Marine Operations sectors in the Pacific Region is difficult to assess because much of the state-level data is suppressed for confidentiality purposes. It is clear, however, that these sectors play an important role in the regional economy. For example, the Ship and Boatbuilding sector contributed more than 300 jobs and more than $\$ 800$ million in payroll to the region in 2014.

[^22]Tables | Pacific Region

## MANAGEMENT CONTEXT

The U.S. Pacific Islands Region includes the state of Hawaiii; the territories of American Samoa and Guam; the Commonwealth of the Northern Mariana Islands (CNMI); and the Pacific Remote Island Areas. Federal fisheries in this region are managed by the Western Pacific Fishery Management Council (WPFMC) and NOAA Fisheries under five fishery ecosystem plans (FEPs). These plans focus on place-based rather than species- or fishery-based management.

## Western Pacific Fishery Ecosystem Plans

- American Samoa
- Hawai'i
- Mariana Archipelago (Guam and the CNMI)
- Pacific Remote Island Areas
- Western Pacific Pelagics

Because fishery data are limited in most of these areas, only information for the Hawai'i and Western Pacific Pelagics fisheries is reported here. No catch share programs operate in this region.

Hawai'i FEP: NOAA Fisheries, the WPFMC, and the State of Hawai'i collaborate to manage fisheries across the Hawai'i Archipelago. The major fisheries in Hawai'i include trolling for pelagic species such as tuna, marlin, wahoo and mahimahi; deepwater hook-and-line bottom fishing; and various forms of net fishing that target nearshore pelagic and reef fish species. Under this FEP, the Hancock Seamount groundfish complex is currently overfished. This fishery has been closed since 1986.

Western Pacific Pelagics FEP: The management species covered under this FEP include tunas, billfishes, sharks, squids, and an assortment of other species. These species include mahimahi, wahoo, moonfish, and pomfret caught by the Hawai'i longline fishery and smaller boats that use diverse gears including trolling, handline, and traditional fishing methods. Of these species, bigeye tuna, Pacific bluefin tuna, swordfish, and the Central Western Pacific striped marlin stock are considered subject to overfishing. The Central Western Pacific striped marlin stock and Pacific bluefin tuna stock are also listed as overfished.

In addition to management by the WPFMC and NOAA

Fisheries, pelagic fish, such as bigeye and yellowfin tunas, are managed by two regional fishery management organizations (RFMOs). The Western and Central Pacific Fisheries Commission (WCPFC) have authority to manage pelagic fisheries in the Western and Central Pacific Ocean, while the Inter-American Tropical Tuna Commission (IATTC) manages pelagic fisheries in the Eastern Pacific Ocean. Fish species and fisheries under the purview of both RFMOs migrate across national boundaries and between RFMO areas, requiring coordinated management. Since 2009, the annual bigeye tuna catch limit has been recommended by the WCPFC and implemented by NOAA Fisheries for the U.S. longline fleet in the Western and Central Pacific. The IATTC establishes the harvest limit for bigeye tuna for U.S. longline vessels longer than 24 meters in the Eastern Tropical Pacific.

## Policy Updates

The Hawaiti-based pelagic longline fleet accounts for most of the U.S. longline catch of bigeye tuna in the WCPO. The 2015 bigeye catch limit for U.S. longline vessels was set at 3,502 metric tons. NOAA Fisheries projected that the fishery would reach the limit on August 5, 2015, after which the fleet would no longer be able to retain and land bigeye tuna unless NOAA Fisheries authorized specified fishing agreements with U.S. Territories before the end of the year. On October 9, 2015, the U.S. Iongline vessels that signed onto a specified fishing agreement with CNMI could collectively fish up to 1,000 metric tons and attribute the catch to CNMI. The U.S. longline vessels that signed onto a specified fishing agreement with Guam could fish up to 1,000 metric tons and attribute that catch to Guam, effective November 6, 2015.

On February 3, 2016, NOAA Fisheries published a final rule allowing large federally permitted U.S. longline vessels to fish in certain areas of the American Samoa Large Vessel Prohibited Area (LVPA). The LVPA was established in 2002 to prevent the potential for gear conflicts and catch competition between large and small fishing vessels. However, the American Samoa pelagic fisheries had changed so that the conditions that led to the establishment of the LVPA appeared to no longer exist. This action had allowed fishing in an additional $16,817 \mathrm{~nm} 2$ of federal waters. On March 20, 2017, a U.S. federal judge in American Samoa v. National Marine Fisheries Service,

16-cv-00095 (D.Haw) issued an order that vacates and sets aside the regulations at 50 CFR 665.818(b), therefore, disallowing large federally permitted U.S. longline vessels to fish within the LVPA.

## COMMERCIAL FISHERIES

In this report, commercial fisheries refer to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fishermen. It also excludes the for hire sector, which earns its revenue from selling recreational fishing trips to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and exvessel prices of key species/species groups.

## Key Western Pacific Commercial Species

- Lobsters - Scad
- Mahimahi - Snappers
- Marlin - Swordfish
- Moonfish - Tunas
- Pomfret - Wahoo
```

## Economic Impacts

The premise behind economic impact modeling is that every dollar spent in a regional economy (direct impact) is either saved or respent on additional goods or services. If those dollars are respent on other goods and services in the regional economy, this spending generates additional economic activity in the region. This report provides estimates of total economic impacts for the Nation and for each of the 23 coastal states. Total economic impacts for each state and the Nation represent the sum of direct impacts; indirect impacts (in this case, the impact from suppliers to the seafood industry); and induced impacts (spending by employees on personal and household expenditures, where employees of both seafood businesses and its full supply chain are included). That is, impacts from the seafood industry as well as the economic activity generated throughout each region's broader economy from this industry.

Four different measures are commonly used to show commercial fisheries landings affect the economy in a region (state or nationwide): sales, income, value-
added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as commercial fishing. It includes both the direct sales of fish landed and sales made between businesses and households resulting from the original sale. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported directly or indirectly by the sales of seafood or purchases of inputs to commercial fishing. The first three types of measures are calculated in terms of dollars, whereas employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. The United States seafood industry is defined here as the commercial fishing sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers. ${ }^{1}$

In 2015, the commercial fishing and seafood industry in the state of Hawaiti generated $\$ 814$ million in sales impacts, $\$ 247$ million in income impacts, $\$ 362$ million in value-added impacts, and 9,000 full- and part-time jobs. The retail sector generated the largest employment impacts across sectors (3,700 jobs). The importers sector generated the largest sales impacts ( $\$ 323$ billion), the retail sector generated the largest income impacts (\$91 million), and the retail sector generated the largest valueadded impacts (\$118 million).

## Landings Trends

Landings and landings revenue trends for the 2006 to 2015 period can be understood only after considering the growth of the tuna fishery. Hawai'i accounted for 61 percent of all tuna landings revenue in the U.S. in 2015, earning $\$ 84$ million for its catch. From 2006 to 2015, tuna revenue increased $\$ 39$ million, increasing 88 percent. Bigeye tuna dominated Hawaiti's landings revenue in 2015 at $\$ 11$ million, an increase of $\$ 25$ million from 2006 and a $\$ 10$ million increase from 2014. Bigeye tuna accounted for at least 50 percent of Hawai'i's landings revenue each year from 2006 to 2015.

## Landings Revenue

In 2015, landings revenue totaled about $\$ 111$ million, a

## Landings Revenue: Largest Increases

From 2006:

- Pomfret ( $123 \%, 87 \%$ in real terms)
- Tunas $(88 \%, 58 \%$ in real terms)
- Moonfish (opah) ( $65 \%, 43 \%$ in real terms)

From 2014:

- Pomfret (20\%)
- Scad (18\%)
- Tunas (14\%)

## Landings Revenue: Largest Decreases

From 2006:

- Lobster ( $-20 \%,-91 \%$ in real terms)
- Swordfish ( $-12 \%,-44 \%$ in real terms)

From 2014:

- Lobster (-54\%)
- Swordfish (-14\%)
- Snappers (-8\%)

66\% increase from 2006 (a 47\% increase in real terms after adjusting for inflation) and a $10 \%$ increase from 2014. Finfish landings revenue accounted for more than 99\% of all landings revenue. In 2015, tunas (\$84 million), swordfish ( $\$ 5$ million), and mahi-mahi (dolphin, $\$ 5$ million) dominated landings revenue. From 2006 to 2015, pomfret ( $123 \%, 87 \%$ in real terms); tunas ( $88 \%, 58 \%$ in real terms); and moonfish (opah, 65\%, $43 \%$ in real terms) had the largest revenue increases, while lobster ( $-20 \%$, $-91 \%$ in real terms) and swordfish ( $-12 \%,-24 \%$ in real terms) had the largest decreases. From 2014 to 2015, pomfret (20\%), scad (18\%), and tunas (14\%) had the largest revenue increases, while lobster ( $-54 \%$ ), swordfish $(-14 \%)$, and snappers ( $-8 \%$ ) had the largest decreases.

## Landings

In 2015, commercial fishermen in the Western Pacific Region landed more than 36 million pounds of finfish and shellfish in the state of Hawai'i. This represents a $41 \%$ increase from 2006 and a 9\% increase from 2014. Tunas contributed the most to landings, accounting for 64\% of total landings. From 2006 to 2015, pomfret (133\%); moonfish (opah, 89\%); and tunas (60\%) had the largest landings increases, while lobster (-33\%), swordfish $(-21 \%)$, and snappers ( $-11 \%$ ) had the largest decreases.

## Landings: Largest Increases

From 2006:

- Pomfret (133\%)
- Moonfish (opah) (89\%)
- Tunas (60\%)

From 2014:

- Tunas (16\%)
- Marlin (15\%)
- Scad (15\%)

## Landings: Largest Decreases

From 2006:

- Lobster (-33\%)
- Swordfish (-21\%)
- Snappers (-11\%)

From 2014:

- Lobster (-60\%)
- Swordfish (-18\%)
- Mahi-mahi (dolphin) (-18\%)

From 2014 to 2015, tunas (16\%), marlin (15\%), and scad (15\%) had the largest landings increases, while lobster (-60\%), swordfish (-18\%), and mahi-mahi (dolphin, $-18 \%)$ had the largest decreases.

## Price

In 2015, snappers ( $\$ 6.31$ per pound) received the highest ex-vessel price in Hawai'i. Landings of marlin ( $\$ 1.16$ per pound) had the lowest ex-vessel price. From 2006 to 2015, scad ( $41 \%$, $18 \%$ in real terms); snappers ( $31 \%$, $12 \%$ in real terms); and mahi-mahi (dolphin, 23\%, $2 \%$ in real terms) had the largest price increases, while moonfish (opah, $-13 \%,-24 \%$ in real terms); pomfret ( $-4 \%,-22 \%$ in real terms); and wahoo ( $-3 \%,-19 \%$ in real terms) had the largest decreases. From 2014 to 2015, mahi-mahi (dolphin, 27\%); pomfret (10\%); and lobster (7\%) had the largest price increases, while marlin ( $-16 \%$ ), wahoo ( $-5 \%$ ), and tunas ( $-2 \%$ ) had the largest decreases.

## RECREATIONAL FISHERIES

In this report, recreational fisheries refer to fishing for fun rather than to resell fish (commercial fishing) or for subsistence. The recreational fisheries section reports on

## Key Western Pacific Recreational Species

- Blue marlin
- Dolphinfish
- Goatfishes
- Trevallys and other jacks
- Bigeye and mackerel scad
economic impacts and expenditures, angler participation, trips, and catch of key species/species groups.

## Economic Impacts and Expenditures

The contribution of recreational fishing activities ${ }^{2}$ in the United States are reported in terms of economic impacts from angler expenditures. Total annual trip expenditures are estimated by multiplying mean trip expenditures by the estimated number of adult trips in each trip mode (for-hire, private boat, and shore). Total annual durable expenditures are estimated by multiplying mean durable expenditures by the estimated annual number of adult participants in a given state.

Four different measures are commonly used to show how angler expenditures affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as recreational fishing. It includes both the direct sales made by the angler and sales made between businesses and households resulting from that original sale by the angler. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full- and part-time jobs supported directly or indirectly by the purchases made by anglers. The first three measures are calculated in terms of dollars, whereas employment impacts are measured in terms of number of jobs. Note that these categories are not additive. NOAA Fisheries uses a regional impact modeling software, called IMPLAN, to estimate these four types of impacts.

Note that no information is available for durable goods
expenditures related to recreational fishing in Hawai'i.

Economic impacts from recreational fishing activities in Hawai'i totaled 934 jobs in 2015 and generated $\$ 119$ million in sales, $\$ 37$ million in income, and $\$ 60$ million in value-added impacts. Of the three fishing trip modes, trips in the shore fishing mode had the greatest economic impact, accounting for $49 \%$ of employment impacts.

Expenditures for fishing trips in Hawai'i in 2015 totaled more than $\$ 97$ million. A large portion of these trip expenditures came from trips in the shore (48\%) and private boat (28\%) sectors.

## Fishing Trips

In 2015, recreational fishermen took 1.4 million saltwater fishing trips in the state of Hawai'i. This number was a $46 \%$ decrease from 2006 and a 4\% increase from 2015. Of this total, $81 \%$ of fishing trips were taken from the shore sector.

## Participation

The state of Hawai'i has not kept track of participation in recreational fisheries since 2006.

## Harvest and Release

Of Hawai'i's key species and species groups, scads (bigeye and mackerel, 1.2 million fish), goatfishes (829,000 fish), and jacks (trevallys and other jacks, 485,000 fish) were most frequently caught by recreational anglers. From 2006 to 2015, yellowfin tuna (136\%); scads (bigeye and mackerel, 53\%); and blue marlin ( $47 \%$ ) had the largest increases in catch, while dolphinfish (mahi-mahi, -64\%); snappers (-43\%); and smallmouth bonefish ( $-34 \%$ ) had the largest decreases. From 2014 to 2015, blue marlin ( $80 \%$ ); goatfishes (73\%); and scads (bigeye and mackerel, 39\%) had the largest increases in catch, while snappers (-50\%); dolphinfish (mahi-mahi, -15\%); and smallmouth bonefish ( $-10 \%$ ) had the largest decreases.

## MARINE ECONOMY

For this report, the marine economy refers to the economic activity generated by fishing and marine-

[^32]
## Recreational Catch: Largest Increases

From 2006:

- Yellowfin tuna (136\%)
- Scads (bigeye and mackerel) (53\%)
- Blue marlin (47\%)

From 2014:

- Blue marlin (80\%)
- Goatfishes (73\%)
- Scads (bigeye and mackerel) (39\%)

## Recreational Catch: Largest Decreases

From 2006:

- Dolphinfish (mahi-mahi) (-64\%)
- Snappers (-43\%)
- Smallmouth bonefish (-34\%)

From 2014:

- Snappers (-50\%)
- Dolphinfish (mahi-mahi) (-15\%)
- Smallmouth bonefish (-10\%)
related industries in a coastal state. The state marine economy consists of two industry sectors: 1) seafood sales and processing (employer establishments and nonemployer firms); and 2) transport, support, and marine operations (employer establishments). These sectors include several different marine-related industries. ${ }^{3,4}$

To measure the size of the commercial fishing sector in a state's economy relative to the size of the commercial fishing sector in the national economy ${ }^{5}$, researchers use an index called the Commercial Fishing Location Quotient (CFLQ). The CFLQ is calculated as the ratio of the percentage of regional employment in the commercial fishing sector relative to the percentage of national employment in the commercial fishing sector. The U.S. CFLQ is 1 . If a state's CFLQ is less than 1 , then less commercial fishing occurs in this state than the national average. If a state's CFLQ is greater than 1, then more commercial fishing occurs in this state than the national average.

In 2014, the CFLQ for Hawai'i was 4.28. Hawai'i's CFLQ suggests that the level of employment in industries related to commercial fishing in this state is approximately 4.28 times higher than the level of
employment in these industries nationwide.
In 2014, 32,000 establishments operated throughout Hawai'i (including marine and non-marine-related establishments). These establishments employed 519,000 workers and had a total annual payroll of almost $\$ 21$ billion. The region's gross domestic product was approximately $\$ 76$ billion in 2014.

## Seafood Sales and Processing

## Seafood Product Preparation and Packaging:

In 2014, there were 14 non-employer firms (a $27 \%$ increase from 2006) and annual receipts totaled \$1 million (a 10\% decrease from 2006 in real terms).

There were 2 employer establishments (a 33\% decrease from 2006) in 2014. The number of employees and payroll was suppressed for confidentiality purposes for this sector.

Seafood Sales, Retail: In 2014, there were 38 nonemployer firms (a 23\% increase from 2006) and annual receipts totaled \$3.7 million (a 10\% decrease from 2006 in real terms).

There were 26 employer establishments (a 4\% decrease from 2006) in 2014. These establishments employed 305 workers (a $3 \%$ decrease from 2006) and had a total annual payroll of $\$ 7.1$ million (a $12 \%$ increase from 2006 in real terms).

Seafood Sales, Wholesale: There were 30
establishments (a 9\% decrease from 2006) in 2014. These establishments employed 567 workers (a 23\% increase from 2006) and had a total annual payroll of $\$ 21$ million (an 11\% increase from 2006 in real terms).

## Transport, Support, and Marine Operations

Data for the Transport, Support, and Marine Operations sector of Hawai'i's economy were largely suppressed for confidentiality reasons. It is clear, however, that these sectors play an important role in the regional economy. For example, Marine Cargo Handling contributed 700 jobs and more than $\$ 66$ million in payroll to the regional economy in 2014.

[^35]
## New England Region

- Connecticut
- Maine - Massachusetts - New Hampshire - Rhode Island

## MANAGEMENT CONTEXT

The New England Region includes Connecticut, Maine, Massachusetts, New Hampshire, and Rhode Island. Federal fisheries in this region are managed by the New England Fishery Management Council (NEFMC) and NOAA Fisheries under nine fishery management plans (FMPs). Two of these FMPs, monkfish and spiny dogfish, are developed in conjunction with the Mid-Atlantic Fisheries Management Council (MAFMC). The MAFMC is the lead council for the Spiny Dogfish FMP; the NEFMC is the lead for the Monkfish FMP.

- Spiny dogfish
(with the MAFMC)
- Red crab
- Northeast skate complex
- Atlantic salmon
,

## New England Regional FMPs

- Northeast multi-species
- Sea scallops
- Monkfish (with the MAFMC)
- Atlantic herring
- Small mesh multi-species -

Fourteen of the stocks or stock complexes covered in these FMPs were listed as overfished in 2015: Atlantic cod (two stocks), Atlantic halibut, Atlantic salmon, Atlantic wolffish, ocean pout, thorny skate, windowpane flounder, winter flounder (two stocks), witch flounder, and yellowtail flounder (three stocks). Seven stocks or stock complexes are currently subject to overfishing: Atlantic cod (two stocks), witch flounder, yellowtail flounder (three stocks), and winter flounder (Georges Bank stock).

## Catch Share Programs

Two catch share programs operate in the New England Region: 1) Northeast Multi-Species Sectors; and 2) Northeast General Category Atlantic Sea Scallop Individual Fishing Quota (IFQ) Program. Following are descriptions of these catch share programs and their performance.

Northeast Multi-species Sectors: This program was developed between 2004 and 2006 and included two pilot sectors that operated with an allocation of Georges Bank cod. The program was expanded in 2010 to 17 sectors, and approximately 55\% of eligible, limited-ac-
cess permit holders joined a sector. At the same time, annual catch limits were implemented for the first time and sharply reduced the available quota for fishermen. The key performance indicators of this program show that compared with the baseline period (the 3-year period prior to implementation), the following 2014 metrics decreased: quotas, landings, number of active vessels, and inflation-adjusted revenue for catch share species. On the other hand, inflation-adjusted revenue per vessel increased during this period.

## Northeast General Category Atlantic Sea Scallop

 IFQ Program: This program began in 2010 with two primary objectives: 1) Control capacity and mortality in the General Category Scallop fishery; and 2) Allow better and timelier integration of sea scallop assessment results in management. The key performance indicators of this program show that 2014 inflation-adjusted revenue and revenue per vessel increased. However, landings, quota, and the number of active vessels decreased compared with the baseline period.
## Policy Updates

In January 2015, NOAA Fisheries approved a final rule that implements conservation measures for the Southern New England stock of American lobster, as recommended by the Atlantic States Marine Fisheries Commission. These measures were taken to conserve the severely depleted stock and included increasing the minimum carapace size increase to 3 17/32 inches in fishing year (FY) 2015, seasonal closures and a fishing trap reduction schedule. Beginning in FY 2016, the number of allowable traps will be reduced 25\% in Area 2 (Southern New England waters primarily off Rhode Island and Southern Massachusetts) and 5\% in offshore Area 3 (offshore fishery from Maine to North Carolina) and then ratcheted down 5\% each year through FY2020 in Area 3 and through FY2021 in Area 2. In June 2015, NOAA Fisheries announced a lobster trap transfer program that applies to Area 2, the Outer Cape Cod Area, and Area 3. This program allows qualified vessels to buy and sell individual traps to a specified maximum in these areas, giving lobster permit holders more flexibility. Federal lobster permit holders from other areas may also "buy in" to these areas by purchasing traps through this program. The new trap allocations became effective for the start of the 2016 fishing year on May 2, 2016.

Also in 2015, the NEFMC finalized recommendations for Amendment 18 to the Northeast Multispecies Fishery Management Plan. Measures of this amendment focus on creating permit caps and on limiting the holdings of individuals, permit banks, and other "entities." This amendment would also constrain an individual's potential sector contribution, or PSC-the proportion of the total landings of a particular groundfish stock (live pounds) associated with the history of each limited access permit and other detailed information. The specifics voted on at the meeting are as follows: Accumulation Limits, Handgear A Permits, Data Confidentiality, Inshore/Offshore Gulf of Maine, and Redfish Exemption Area.

In early 2016, Framework 55 was approved and implemented in the Northeast Multispecies Fishery Management Plan. The framework incorporates status changes for groundfish stocks; sets specifications for all groundfish stocks, including catch limits for the U.S./Canada Resource Sharing Understanding and the distribution of allowable catch limits to various components of the fishery; updates fishery program administration; and adjusts management measures for commercial and recreational fisheries that catch groundfish stocks. These actions are needed to prevent overfishing, ensure rebuilding of overfished stocks, and help with achieving optimum yield in the fishery consistent with the status of stocks and the requirements of the Magnuson-Stevens Act of 2006. These actions will also help improve the enforcement of conservation gear, and provide additional flexibility within the sector system and recreational fishery in the face of changing regulations and legal circumstances.

## COMMERCIAL FISHERIES

In this report, commercial fisheries refer to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fishermen. It also excludes the for hire sector, which earns its revenue from selling recreational fishing trips to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and ex-vessel prices of key species/species groups.

## Economic Impacts

The premise behind economic impact modeling is that

## Key New England Region Commercial Species

- American lobster - Goosefish
- Atlantic herring
- Quahog clam
- Atlantic mackerel
- Sea scallop
- Cod and haddock
- Softshell clam
- Flounders
- Squid
every dollar spent in a regional economy (direct impact) is either saved or respent on additional goods or services. If those dollars are respent on other goods and services in the regional economy, this spending generates additional economic activity in the region. This report provides estimates of total economic impacts for the Nation and for each of the 23 coastal states. Total economic impacts for each state and the Nation represent the sum of direct impacts; indirect impacts (in this case, the impact from suppliers to the seafood industry); and induced impacts (spending by employees on personal and household expenditures, where employees of both seafood businesses and its full supply chain are included). That is, impacts from the seafood industry as well as the economic activity generated throughout each region's broader economy from this industry.

Four different measures are commonly used to show commercial fisheries landings affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as commercial fishing. It includes both the direct sales of fish landed and sales made between businesses and households resulting from the original sale. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported directly or indirectly by the sales of seafood or purchases of inputs to commercial fishing. The first three types of measures are calculated in terms of dollars, whereas employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. The United States seafood industry is defined here as the commercial fishing sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers. ${ }^{1}$

[^36]
## Landings Revenue: Largest Increases

From 2006:

- American lobster (55\%, 34\% in real terms)
- Sea scallop ( $8 \%,-6 \%$ in real terms)

From 2014:

- Softshell clam (13\%)
- Squid (13\%)
- Quahog clam (12\%)

## Landings Revenue: Largest Decreases

From 2006:

- Atlantic herring $(-85 \%,-87 \%$ in real terms)
- Atlantic mackerel $(-77 \%,-80 \%$ in real terms $)$
- Quahog clam ( $-60 \%,-66 \%$ in real terms)

From 2014:

- Atlantic herring (-13\%)
- Cod and haddock (-8\%)
- Flounders (-8\%)

In 2015, commercial fishing in Massachusetts generated the largest employment impacts in the New England Region with 83,000 jobs. Massachusetts had the largest income impacts ( $\$ 1.9$ billion), sales impacts ( $\$ 7.3$ billion), and value-added impacts ( $\$ 2.9$ billion).

The retail sector in Massachusetts generated the highest employment impacts of any state-level sector with 50,700 jobs. The importers sector in Massachusetts generated the highest state-level income impacts ( $\$ 0.6$ billion), the highest state-level sales impacts ( $\$ 3.8$ billion), and the highest state-level value-added impacts in the region (\$1.2 billion).

## Landings Trends

The lobster fishery, New England's largest fishery in terms of landings revenue, continued its strong performance, with revenues up 55 percent since 2006 due to higher landings and higher prices (up 54\% and 101\%, respectively) and up 10 percent since 2014 due to higher prices (up 10\%). The higher landings trend is due to unprecedented abundance levels of Gulf of Maine lobsters, which have comprised between 85-90\% of landings in recent years. Indeed, average annual landings the past five years are three times the average annual landings for the previous 60 years. On average, Maine

## Landings: Largest Increases

From 2006:

- American lobster (54\%)

From 2014:

- Goosefish (5\%)
- Cod and haddock (1\%)

## Landings: Largest Decreases

From 2006:

- Atlantic mackerel (-90\%)
- Quahog clam (-76\%)
- Softshell clam (-57\%)

From 2014:

- Atlantic mackerel (-23\%)
- $\quad$ Squid ( $-18 \%$ )
- Flounders (-14\%)
has accounted for 79\% of New England's lobster landings revenue since 2006.

Sea scallop landings declined 44 percent over this 10-year period primarily due to a 35 percent reduction in the catch limit that was implemented in 2012 to protect young sea scallops and prevent localized overfishing. Significantly higher prices (up 192\% from 2006 but down 3\% from 2014) has helped to offset the lower landings.

## Landings Revenue

Landings revenue in the New England Region totaled \$1.2 billion in 2015. This number represents a $9 \%$ increase from 2006 (a 6\% decrease in real terms after adjusting for inflation) and a 4\% increase from 2014. Landings revenue was highest in Maine (\$588 million) followed by Massachusetts ( $\$ 525$ million). Shellfish landings revenue made up $85 \%$ of total revenue. American lobster (\$615 million) and sea scallop ( $\$ 287$ million) had the highest landings revenue in the New England Region in 2015. Together they accounted for $73 \%$ of total landings revenue.

From 2006 to 2015, American lobster (55\%, 34\% in real terms) and sea scallop ( $8 \%,-6 \%$ in real terms) had the largest revenue increases, while Atlantic herring (-85\%, $-87 \%$ in real terms); Atlantic mackerel ( $-77 \%,-80 \%$ in
real terms); and quahog clam ( $-60 \%,-66 \%$ in real terms) had the largest decreases. From 2014 to 2015, softshell clam (13\%), squid (13\%), and quahog clam (12\%) had the largest revenue increases, while Atlantic herring (-13\%), cod and haddock (-8\%), and flounders (-8\%) had the largest decreases.

## Landings

In 2015, commercial fishermen in the New England Region landed about 599 million pounds of finfish and shellfish, a 20\% decrease from 2006 and a 7\% decrease from 2014. Landings volume was highest in Massachusetts ( 261 million pounds), followed by Maine ( 242 million pounds). Atlantic herring had the highest landings volume in the New England Region, accounting for 29\% of landed weight.

From 2006 to 2015, American lobster (54\%) had the largest landings increase, while Atlantic mackerel (-90\%), quahog clam (-76\%), and softshell clam (-57\%) had the largest decreases. From 2014 to 2015, goosefish (5\%) and cod and haddock (1\%) had the largest landings increases, while Atlantic mackerel (-23\%), squid (-18\%), and flounders ( $-14 \%$ ) had the largest decreases.

## Price

In 2015, sea scallop ( $\$ 12.31$ per pound) received the highest ex-vessel price in the New England Region. Landings of Atlantic herring ( $\$ 0.14$ per pound) had the lowest ex-vessel price. From 2006 to 2015, Atlantic mackerel (129\%, 98\% in real terms); sea scallop (92\%, 66\% in real terms); and softshell clam ( $86 \%, 58 \%$ in real terms) had the largest price increases, while Atlantic herring (-79\%, -82\% in real terms) and cod and haddock (-22\%, $-33 \%$ in real terms) had the largest decreases. From 2014 to 2015, Atlantic mackerel (38\%), squid (38\%), and quahog clam (21\%) had the largest price increases, while cod and haddock (-9\%), and sea scallop (-3\%) had the largest decreases.

## RECREATIONAL FISHERIES

In this report, recreational fisheries refer to fishing for fun rather than to resell fish (commercial fishing) or for subsistence. The recreational fisheries section reports
on economic impacts and expenditures, angler participation, trips, and catch of key species/species groups.

## Key New England Recreational Species

| - Atlantic cod | - Scup |

## Economic Impacts and Expenditures

The contribution of recreational fishing activities ${ }^{2}$ in the United States is reported in terms of economic impacts from angler expenditures. Total annual trip expenditures are estimated by multiplying mean trip expenditures by the estimated number of adult trips in each trip mode (for-hire, private boat, and shore). Total annual durable expenditures are estimated by multiplying mean durable expenditures by the estimated annual number of adult participants in a given state.

Four different measures are commonly used to show how angler expenditures affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as recreational fishing. It includes both the direct sales made by the angler and sales made between businesses and households resulting from that original sale by the angler. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full- and part-time jobs supported directly or indirectly by the purchases made by anglers. The first three measures are calculated in terms of dollars, whereas employment impacts are measured in terms of number of jobs. Note that these categories are not additive. NOAA Fisheries uses a regional impact modeling software, called IMPLAN, to estimate these four types of impacts.

The greatest employment impacts from expenditures on saltwater recreational fishing in the New England Region

[^37]were generated in Massachusetts (9,100 jobs), followed by Connecticut (3,400 jobs). The largest sales impacts were observed in Massachusetts (\$1 billion), followed by Connecticut ( $\$ 367$ million). The biggest income impacts were generated in Massachusetts (\$455 million), followed by Connecticut ( $\$ 159$ million). The greatest value-added impacts were in Massachusetts ( $\$ 657$ milIion), followed by Connecticut ( $\$ 248$ million).

Recreational fishing expenditures (on both fishing trips and durable equipment purchases) across the New England Region in 2015 totaled about $\$ 1.7$ billion. Trip expenditures totaled more than $\$ 260$ million, with a large portion coming from trips in the private boat (47\%) and for-hire ( $28 \%$ ) sectors. Durable goods expenditures totaled $\$ 1.4$ billion, with the largest portion coming from boat expenses ( $\$ 870$ million).

## Fishing Trips

In 2015, recreational fishermen took 5 million fishing trips in the New England Region. This number was a 45\% decrease from 2006 and a 24\% decrease from 2014. The largest proportions of trips were taken in the private boat mode (53\%) and shore mode ( $40 \%$ ). States with the highest number of recorded trips were Massachusetts (2.2 million trips) and Connecticut (1.3 million trips).

## Participation

In 2015, there were 1 million recreational anglers who fished in the New England Region. This number was a $36 \%$ decrease from 2006 and a 14\% decrease from 2014. These anglers were New England Region residents from either a coastal county (91\%) or non-coastal county (9\%).

## Harvest and Release

Of New England's key species and species groups, Atlantic mackerel ( 6.1 million fish), porgies (scup, 4.4 million fish), and striped bass ( 3.3 million fish) were most frequently caught by recreational anglers. From 2006 to 2015, little tunny (433\%), Atlantic mackerel (30\%), and winter flounder (27\%) had the largest increases in catch, while striped bass (-78\%), bluefish (-70\%), and summer flounder (-64\%) had the largest decreases. From 2014 to 2015, Atlantic mackerel (31\%) and

## Recreational Catch: Largest Increases

From 2006:

- Little tunny (433\%)
- Atlantic mackerel (30\%)
- Winter flounder (27\%)

From 2014:

- Atlantic mackerel (31\%)
- Striped bass (5\%)

## Recreational Catch: Largest Decreases

From 2006:

- Striped bass (-78\%)
- Bluefish (-70\%)
- Summer flounder (-64\%)

From 2014:

- Little tunny (-67\%)
- Wrasses (tautog) (-62\%)
- Bluefish (-56\%)
striped bass (5\%) had the largest increases in catch, while little tunny (-67\%), wrasses (tautog) (-62\%), and bluefish (-56\%) had the largest decreases.

## MARINE ECONOMY

For this report, the marine economy refers to the economic activity generated by fishing and marine-related industries in a coastal state. The state marine economy consists of two industry sectors: 1) seafood sales and processing (employer establishments and non-employer firms); and 2) transport, support, and marine operations (employer establishments). These sectors include several different marine-related industries. ${ }^{3,4}$

To measure the size of the commercial fishing sector in a state's economy relative to the size of the commercial fishing sector in the national economy ${ }^{5}$, researchers use an index called the Commercial Fishing Location Quotient (CFLQ). The CFLQ is calculated as the ratio of the percentage of regional employment in the commercial fishing sector relative to the percentage of national employment in the commercial fishing sector. The U.S. CFLQ is 1. If a state's CFLQ is less than 1 , then less commercial fishing occurs in this state than the national average. If a state's CFLQ is greater than 1 , then more commercial

[^38]fishing occurs in this state than the national average.

The Bureau of Labor Statistics did not disclose CFLQ data for Connecticut, Massachusetts, and New Hampshire for 2014. In 2014, the CFLQ for Maine was the highest for the remaining states in the region at 19.79. Maine's CFLQ suggests that the level of employment in industries related to commercial fishing in this state is approximately 19.79 times higher than the level of employment in these industries nationwide.

In 2014, 368,000 establishments operated throughout the New England Region (including marine and non-ma-rine-related establishments). These establishments employed 6 million workers and had a total annual payroll of $\$ 339$ billion. The region's gross domestic product was $\$ 885$ billion in 2014.

## Seafood Sales and Processing

## Seafood Product Preparation and Packaging:

In 2014, there were 110 non-employer firms (a 3\% decrease from 2006) and annual receipts totaled $\$ 13$ million (a $25 \%$ decrease from 2006 in real terms). The greatest number of firms was located in Maine (37).

There were 82 employer establishments (a 14\% decrease from 2006) in 2014. These establishments employed approximately 2,365 workers (a $34 \%$ decrease from 2006) and had a total annual payroll of $\$ 118$ million (a $28 \%$ decrease from 2006 in real terms). The greatest number of establishments was located in Massachusetts (42).

Seafood Sales, Retail: In 2014, there were 162 non-employer firms (a 4\% increase from 2006) and annual receipts totaled $\$ 16$ million (a $30 \%$ decrease from 2006 in real terms). The greatest number of firms was located in Maine (57).

There were 239 employer establishments (a $4 \%$ decrease from 2006) in 2014. These establishments employed 1,240 workers (a 8\% increase from 2006) and had a total annual payroll of $\$ 39$ million (a $13 \%$ increase from 2006 in real terms). The greatest number of establishments was located in Massachusetts (114).
Seafood Sales, Wholesale: There were 327 es-
tablishments (a 12\% decrease from 2006) in 2014. These establishments employed 3,372 workers (a 17\% increase from 2006) and had a total annual payroll of $\$ 163$ million (a $19 \%$ increase from 2006 in real terms). The greatest number of establishments was located in Maine (142).

## Transport, Support, and Marine Operations

The size of the Transport, Support, and Marine Operations sectors in the New England Region is difficult to assess because so much of the state-level data is suppressed for confidentiality purposes. It is clear, however, that these sectors play an important role in the regional economy. For example, 484 establishments in the Marinas sector contributed more than 3,300 jobs and more than \$160 million in payroll to the regional economy in 2014.

[^51]
## Mid-Atlantic Region

- Delaware
- Maryland
- New Jersey
- New York - Virginia

## MANAGEMENT CONTEXT

The Mid-Atlantic Region includes Delaware, Maryland, New Jersey, New York, and Virginia. Federal fisheries in this region are managed by the Mid-Atlantic Fishery Management Council (MAFMC) and NOAA Fisheries under seven fishery management plans (FMPs). Two of these FMPs are developed in conjunction with the New England Fishery Management Council (NEFMC). The MAFMC is the lead council for the Spiny Dogfish FMP; the NEFMC is the lead for the Monkfish FMP.

## Mid-Atlantic Region FMPs

- Atlantic mackerel - Surfclam and squids and
butterfish $\quad$ ocean quahog
Golden tilefish
- Golden tilefish
- Atlantic bluefish - Monkfish (with
- Spiny dogfish (with the NEFMC) the NEFMC)
- Summer flounder, scup and black sea bass

Summer flounder was listed as experiencing overfishing in 2015.

## Catch Share Programs

Two catch share programs operate in the Mid-Atlantic: 1) Atlantic Surfclam and Ocean Quahog Individual Transferable Quota (ITQ) Program; and 2) Golden Tilefish Individual Fishing Quota (IFQ) Program. Following is a description of these catch share programs and their performance. Each program is described separately because the surfclam and ocean quahog fisheries are prosecuted as independent fisheries despite being in the same ITQ program.

Atlantic Surfclam ITQ Program: This program was implemented in 1990 to conserve the surfclam resource and stabilize harvest rates; simplify regulatory requirements to minimize public and private management costs; promote economic efficiency by bringing harvest capacity in line with processing and biological capacity; and create a management approach that is flexible and adaptive to short-term events or circumstances. The key performance indicators of this program show that compared with the baseline period (the 3-year period
prior to implementation), the 2014 quota and infla-tion-adjusted revenue per vessel increased. However, landings, the number of active vessels, and inflation-adjusted total revenue decreased.

Atlantic Ocean Quahog ITQ Program: This program was implemented in 1990 to conserve the quahog resource and stabilize harvest rates; simplify regulatory requirements to minimize public and private management costs; promote economic efficiency by bringing harvest capacity in line with processing and biological capacity; and create a management approach that is flexible and adaptive to short-term events or circumstances. The key performance indicators of this program show that relative to the baseline period (the 3 -year period prior to implementation), the 2014 infla-tion-adjusted revenue per vessel increased. However, quota, landings, number of active vessels, and infla-tion-adjusted total revenue decreased.

Golden Tilefish IFQ Program: This program was implemented in 2009 to reduce over-capacity and eliminate problems associated with the race to fish golden tilefish. This IFQ program is unique because many key events occurred outside the traditional management process. Prior to the implementation of the IFQ program, fishermen crafted internal agreements that promoted cooperation. Their cooperative processes helped fishing businesses stay viable under new regulations, which laid the foundation for implementing the IFQ program. The key performance indicators of this program show that relative to the baseline period (the 3-year period prior to implementation), the 2014 quota, landings, inflation-adjusted revenue, and inflation-adjusted revenue per vessel increased. However, the number of active vessels decreased.

## Policy Updates

In June 2015, the MAFMC approved an amendment to the mackerel, squid, and butterfish FMP to protect deep sea corals from the impacts of bottom-tending fishing gear in the Mid-Atlantic. If approved by the Secretary of Commerce, the amendment will create "deep sea coral zones" in areas where corals have been observed or where they are likely to occur. Within these zones, fishermen will not be allowed to use any type of bot-
tom-tending fishing gear such as trawls, dredges, bottom longlines, and traps. In total, the areas proposed for designation as deep sea coral zones encompass more than 38,000 square miles.

The measures approved by the MAFMC include the designation of 15 "discrete coral zones," which are areas of known or highly likely coral presence and fall within the broad zones. Most of these areas are located around underwater canyons or slope areas along the continental shelf edge. In addition, the MAFMC voted to establish a "broad coral zone" encompassing a much larger area beginning around the 450-meter depth contour and extending out to the 200-mile limit of the U.S. exclusive economic zone (EEZ).

The MAFMC also approved an exemption from gear restrictions for the red crab fishery. This exemption would apply indefinitely in the broad zones and for at least 2 years in the discrete zones. The MAFMC also approved a provision that would allow vessel transit through or across all deep sea coral zones with a requirement that the vessel's fishing gear be stowed during transit. The amendment would also require the use of vessel monitoring systems for all Illex squid moratorium vessels regardless of whether fishing activity is occurring within or outside any proposed deep sea coral zones.
The MAFMC recommended a substantial cut in the commercial quota for spiny dogfish for 2016. The council's decision was driven by the recent update to the spiny dogfish stock assessment, which estimated the stock's biomass to be at $87 \%$ of the rebuilt target in 2015. Although the stock was found to be neither overfished nor subject to overfishing, the new estimate of stock biomass was a marked decrease from the 2013 update, which indicated that the stock's biomass was at $135 \%$ of the target. Following a review of the most recent scientific information, public comments, and advice from the Scientific and Statistical Committee (SSC) and Spiny Dogfish Advisory Panel, the council voted to set the 2016 commercial quota at 25.3 million pounds, a $50 \%$ reduction from the 2015 quota of 50.6 million pounds. If approved by NOAA Fisheries, the new measure would have been in effect as of May 1, 2016.

In the Northeastern United States, butterfish and long-
fin squid are often found in the same areas, and as a result, butterfish is often caught as bycatch in the squid fishery. Because there are caps on butterfish bycatch, the squid fishery can be forced to close early if the limit is exceeded. Scientists at Cornell University's Cooperative Extension Marine Program used funding from NOAA Fisheries' Bycatch Reduction Engineering Program to expand their successful real-time bycatch avoidance network. So far, 61 vessels send and receive "hot spot" locations of river herring, shad, and butterfish through their vessel monitoring system. The fleet then uses this information to avoid fishing in these locations and avoid bycatch. From 2012 to 2015, butterfish bycatch was reduced by more than 65 percent. The outstanding reduction of butterfish bycatch is a direct result of coordination and collaboration between commercial fishermen and scientists.

## COMMERCIAL FISHERIES

In this report, commercial fisheries refer to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fishermen. It also excludes the for hire sector, which earns its revenue from selling recreational fishing trips to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and ex-vessel prices of key species/species groups.

## Key Mid-Atlantic Region Commercial Species

- American lobster - Quahog clam
- Atlantic surfclam - Sea scallop
- Blue crab - Squid
- Eastern oyster - Striped bass
- Menhaden - Summer flounder

## Economic Impacts

The premise behind economic impact modeling is that every dollar spent in a regional economy (direct impact) is either saved or respent on additional goods or services. If those dollars are respent on other goods and services in the regional economy, this spending generates additional economic activity in the region. This report provides estimates of total economic impacts for the Nation and for each of the 23 coastal states. Total

## Landings Revenue: Largest Increases

From 2006:

- Eastern oyster ( $805 \%, 682 \%$ in real terms)
- Quahog clam (98\%, $71 \%$ in real terms)
- Blue crab ( $80 \%, 55 \%$ in real terms)

From 2014:

- Menhaden ( $21 \%$ )
- Sea scallop (20\%)
- Blue crab (12\%)

## Landings Revenue: Largest Decreases

From 2006:

- American lobster ( $-65 \%,-70 \%$ in real terms)
- Atlantic surfclam $(-56 \%,-62 \%$ in real terms $)$

From 2014:

- Striped bass (-24\%)
- American lobster (-14\%)
- Atlantic surfclam (-6\%)
economic impacts for each state and the Nation represent the sum of direct impacts; indirect impacts (in this case, the impact from suppliers to the seafood industry); and induced impacts (spending by employees on personal and household expenditures, where employees of both seafood businesses and its full supply chain are included). That is, impacts from the seafood industry as well as the economic activity generated throughout each region's broader economy from this industry.

Four different measures are commonly used to show commercial fisheries landings affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as commercial fishing. It includes both the direct sales of fish landed and sales made between businesses and households resulting from the original sale. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported directly or indirectly by the sales of seafood or purchases of inputs to commercial fishing. The first three types of measures are calculated in terms of dollars, whereas

## Landings: Largest Increases

From 2006:

- Eastern oyster (517\%)
- Quahog clam (44\%)
- Blue crab (11\%)

From 2014:

- Blue crab (27\%)
- Sea scallop (19\%)
- Menhaden (15\%)

## Landings: Largest Decreases

## From 2006:

- American lobster (-64\%)
- Atlantic surfclam (-57\%)
- Sea scallop (-35\%)

From 2014:

- Striped bass (-25\%)
- American lobster (-23\%)
- Atlantic surfclam (-6\%)
employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. The United States seafood industry is defined here as the commercial fishing sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers. ${ }^{1}$

In 2015, commercial fishing in New York generated the largest employment impacts in the Mid-Atlantic Region with 39,900 jobs. New Jersey had the largest income impacts ( $\$ 1.3$ billion), sales impacts ( $\$ 6$ billion), and value-added impacts (\$2.1 billion).

The retail sector in New York generated the highest employment impacts of any state-level sector with 20,200 jobs. The importers sector in New Jersey generated the highest state-level income impacts ( $\$ 0.7$ billion), the highest state-level sales impacts ( $\$ 4.5$ billion), and the highest state-level value-added impacts in the region (\$1.4 billion).

## Landings Trends

Both landings and landings revenue increased in the Mid Atlantic Region from 2014 to 2015. Scallops, blue crab and menhaden experienced the largest year over year increase in landings revenue - up \$25 million, \$11
million and \$7 million, respectively, from 2014 to 2015. Blue crab landings revenue was up due to high landings (up $27 \%$ ); blue crab prices were down $12 \%$ year over year, reflecting the national trend (blue crab prices were down 10\% nationally). Oyster landings revenue was up $\$ 2.8$ million from 2014 to 2015 . Both oyster harvest and oyster revenue has been up each year since 2009 with surging aquaculture production in Virginia accounting for the majority of the growth.

## Landings Revenue

Landings revenue in the Mid-Atlantic Region totaled $\$ 512$ million in 2015 . This number represents a $37 \%$ increase from 2006 (an 18\% increase in real terms after adjusting for inflation) and a $7 \%$ increase from 2014. Landings revenue was highest in Virginia (\$199 million) followed by New Jersey (\$166 million). Shellfish landings revenue made up $77 \%$ of total revenue. Sea scallop ( $\$ 151$ million) and blue crab ( $\$ 100$ million) had the highest landings revenue in the Mid-Atlantic Region in 2015. Together they accounted for 49\% of total landings revenue.

From 2006 to 2015, eastern oyster ( $805 \%$, $682 \%$ in real terms); quahog clam ( $98 \%, 71 \%$ in real terms); and blue crab ( $80 \%, 55 \%$ in real terms) had the largest revenue increases, while American lobster (-65\%, -70\% in real terms) and Atlantic surfclam (-56\%, $-62 \%$ in real terms) had the largest decreases. From 2014 to 2015, menhaden ( $21 \%$ ), sea scallop ( $20 \%$ ), and blue crab (12\%) had the largest revenue increases, while striped bass (-24\%), American lobster (-14\%), and Atlantic surfclam ( $-6 \%$ ) had the largest decreases.

## Landings

In 2015, Mid-Atlantic Region commercial fishermen landed more than 648 million pounds of finfish and shellfish, a 6\% decrease from 2006 and a 9\% increase from 2014. Landings volume was highest in Virginia ( 417 million pounds), followed by New Jersey (148 million pounds). Menhaden had the highest landings volume in the Mid-Atlantic Region, accounting for 67\% of landed weight.

From 2006 to 2015, eastern oyster (517\%), quahog clam (44\%), and blue crab (11\%) had the largest land-
ings increases, while American lobster (-64\%), Atlantic surfclam ( $-57 \%$ ), and sea scallop ( $-35 \%$ ) had the largest decreases. From 2014 to 2015, blue crab (27\%), sea scallop (19\%), and menhaden (15\%) had the largest landings increases, while striped bass (-25\%), American lobster (-23\%), and Atlantic surfclam (-6\%) had the largest decreases.

## Price

In 2015, sea scallop ( $\$ 12.35$ per pound) received the highest ex-vessel price in the Mid-Atlantic Region. Landings of menhaden ( $\$ 0.09$ per pound) had the lowest ex-vessel price. From 2006 to 2015, sea scallop ( $91 \%, 65 \%$ in real terms), blue crab ( $62 \%, 40 \%$ in real terms), and striped bass ( $58 \%, 37 \%$ in real terms) had the largest price increases, while American lobster ( $-2 \%,-15 \%$ in real terms) had the largest decrease. From 2014 to 2015, American lobster (11\%), summer flounder (8\%), and menhaden (5\%) had the largest price increases, while blue crab ( $-11 \%$ ) and eastern oyster (-3\%) had the largest decreases.

## RECREATIONAL FISHERIES

In this report, recreational fisheries refer to fishing for fun rather than to resell fish (commercial fishing) or for subsistence. The recreational fisheries section reports on economic impacts and expenditures, angler participation, trips, and catch of key species/species groups.

## Key Mid-Atlantic Region Recreational Species

- Atlantic croaker
- Striped bass
- Black sea bass - Summer flounder
- Bluefish - Tautog
- Scup • Weakfish drum
- Spot - Winter flounder

## Economic Impacts and Expenditures

The contribution of recreational fishing activities ${ }^{2}$ in the United States is reported in terms of economic impacts from angler expenditures. Total annual trip expenditures are estimated by multiplying mean trip expenditures by the estimated number of adult trips in each trip mode (for-hire, private boat, and shore). Total annual durable expenditures were estimated by multiplying mean

[^52]durable expenditures by the estimated annual number of adult participants in a given state.

Four different measures are commonly used to show how angler expenditures affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as recreational fishing. It includes both the direct sales made by the angler and sales made between businesses and households resulting from that original sale by the angler. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full- and part-time jobs supported directly or indirectly by the purchases made by anglers. The first three measures are calculated in terms of dollars, whereas employment impacts are measured in terms of number of jobs. Note that these categories are not additive. NOAA Fisheries uses a regional impact modeling software, called IMPLAN, to estimate these four types of impacts.

The greatest employment impacts from expenditures on saltwater recreational fishing in the Mid-Atlantic Region were generated in New Jersey ( 16,100 jobs), followed by New York ( 7,800 jobs). The largest sales impacts were observed in New Jersey ( $\$ 1.8$ billion), followed by New York ( $\$ 874$ million). The biggest income impacts were generated in New Jersey (\$786 million), followed by New York ( $\$ 377$ million). The greatest value-added impacts were in New Jersey ( $\$ 1.2$ billion), followed by New York (\$587 million).

Recreational fishing expenditures (on both fishing trips and durable equipment purchases) across the Mid-Atlantic Region in 2015 totaled about $\$ 3.5$ billion. Trip expenditures totaled more than $\$ 686$ million, with a large portion coming from trips in the private boat (48\%) and for-hire (28\%) sectors. Durable goods expenditures totaled $\$ 2.8$ billion, with the largest portion coming from boat expenses ( $\$ 1.7$ billion).

## Trips

In 2015, recreational fishermen took 12.4 million fishing trips in the Mid-Atlantic Region. This number was a $40 \%$

## Recreational Catch: Largest Increases

## From 2006:

- There were no increases in catch from 2006.

From 2014:

- Drum (weakfish) (131\%)
- Porgies (scup) (42\%)
- Striped bass (8\%)

## Recreational Catch: Largest Decreases

From 2006:

- Winter flounder (-94\%)
- Drum (weakfish) (-79\%)
- Drum (spot) (-77\%)

From 2014:

- Drum (spot) (-69\%)
- Winter flounder (-50\%)
- Bluefish (-42\%)
decrease from 2006 and a 13\% decrease from 2014. The largest proportions of trips were taken in the private boat mode (49\%) and shore mode (40\%). States with the highest number of recorded trips were New Jersey (4.3 million trips) and New York ( 3.2 million trips).

## Participation

In 2015, 2 million recreational anglers fished in the Mid-Atlantic Region. This number was a $36 \%$ decrease from 2006 and an 11\% decrease from 2014. These anglers were Mid-Atlantic Region residents from either a coastal county (94\%) or non-coastal county (6\%).

## Harvest and Release

Of the Mid-Atlantic Region's key species and species groups, summer flounder ( 10.9 million fish), drum (Atlantic croaker, 8 million fish), and striped bass (6.4 million fish) were most frequently caught by recreational anglers. From 2006 to 2015, there were no increases in catch, while winter flounder (-94\%), drum (weakfish) (-79\%), and drum (spot) (-77\%) had the largest decreases. From 2014 to 2015, drum (weakfish) (131\%), porgies (scup) (42\%), and striped bass (8\%) had the largest increases in catch, while drum (spot) (-69\%), winter flounder ( $-50 \%$ ), and bluefish ( $-42 \%$ ) had the largest decreases.

## MARINE ECONOMY

For this report, the marine economy refers to the economic activity generated by fishing and marine-related industries in a coastal state. The state marine economy consists of two industry sectors: 1) seafood sales and processing (employer establishments and non-employer firms); and 2) transport, support, and marine operations (employer establishments). These sectors include several different marine-related industries. ${ }^{3,4}$

To measure the size of the commercial fishing sector in a state's economy relative to the size of the commercial fishing sector in the national economy ${ }^{5}$, researchers use an index called the Commercial Fishing Location Quotient (CFLQ). The CFLQ is calculated as the ratio of the percentage of regional employment in the commercial fishing sector relative to the percentage of national employment in the commercial fishing sector. The U.S. CFLQ is 1. If a state's CFLQ is less than 1 , then less commercial fishing occurs in this state than the national average. If a state's CFLQ is greater than 1 , then more commercial fishing occurs in this state than the national average.

The Bureau of Labor Statistics did not disclose CFLQ data for Delaware for 2014. In 2014, the CFLQ for New Jersey was the highest for the remaining states in the region at 1.01. New Jersey's CFLQ suggests that the level of employment in industries related to commercial fishing in this state is approximately 1.01 times higher than the level of employment in these industries nationwide.

In 2006, 1.1 million establishments operated throughout the Mid-Atlantic Region (including marine and non-ma-rine-related establishments). These establishments employed 17 million workers and had a total annual payroll of $\$ 990$ billion. The region's gross domestic product was approximately $\$ 2.8$ trillion in 2014.

## Seafood Sales and Processing

## Seafood Product Preparation and Packaging: In

2014, there were 369 non-employer firms (a 68\% increase from 2006) and annual receipts totaled $\$ 25$ million (a 59\% increase from 2006 in real terms). The greatest number of firms was located in New York (181).

There were 69 employer establishments (a 18\% de-
crease from 2006) in 2014. These establishments employed approximately 1,735 workers (a $40 \%$ decrease from 2006) and had a total annual payroll of $\$ 88$ million (a 20\% decrease from 2006 in real terms). The greatest number of establishments was located in Virginia (20).

Seafood Sales, Retail: In 2014, there were 452 non-employer firms (a 1\% increase from 2006) and annual receipts totaled $\$ 37$ million (a $35 \%$ decrease from 2006 in real terms). The greatest number of firms was located in New York (188).

There were 666 employer establishments (a 5\% decrease from 2006) in 2014. These establishments employed 3,326 workers (an 8\% increase from 2006) and had a total annual payroll of $\$ 85$ million (a $22 \%$ increase from 2006 in real terms). The greatest number of establishments was located in New York (401).

Seafood Sales, Wholesale: There were 479 establishments (a 1\% decrease from 2006) in 2014. These establishments employed 3,924 workers (a 9\% decrease from 2006) and had a total annual payroll of $\$ 173$ million (a 13\% decrease from 2006 in real terms). The greatest number of establishments was located in New York (270).

## Transport, Support, and Marine Operations

The size of the Transport, Support, and Marine Operations sectors in the Mid-Atlantic Region is difficult to assess because much of the state-level data is suppressed for confidentiality purposes. It is clear, however, that these sectors play an important role in the regional economy. For example, the Marine Cargo Handling sector contributed over 8,500 jobs and $\$ 700$ million in payroll to the region's economy in 2014. These totals do not include Virginia (for which data is suppressed) and the state's Hampton Roads/Norfolk port complex.

[^53]
## Tables | Mid-Atlantic Region

Mid-Atlantic Region | Commercial Fisheries

|  | Landings Revenue | With Imports |  |  |  | Without Imports |  |  |  |

[^67]
## South Atlantic Region

## MANAGEMENT CONTEXT

The South Atlantic Region includes East Florida, Georgia, North Carolina, and South Carolina. Federal fisheries in this region are managed by the South Atlantic Fishery Management Council (SAFMC) and NOAA Fisheries under eight fishery management plans (FMPs). The coastal migratory pelagic resources and spiny lobster FMPs are managed jointly with the Gulf of Mexico Fishery Management Council (GMFMC). The SAFMC, in cooperation with the Mid-Atlantic and New England Fishery Management Councils, developed a dolphin wahoo FMP for the Atlantic.

## South Atlantic Region FMPs

- Coastal migratory pelagic resources (with GMFMC)
- Coral, coral reef and live/hardbottom habitat
- Dolphin/wahoo
- Golden crab
- Pelagic sargassum habitat
- Shrimp
- Snapper grouper
- Spiny lobster (with GMFMC)

Red porgy, red snapper, snowy grouper, and Florida Keys/ East Florida hogfish were listed as overfished in 2015. Five stocks or stock complexes are currently subject to overfishing: red snapper, speckled hind, Warsaw grouper, Florida Keys/East Florida hogfish, and blueline tilefish.

## Catch Share Programs

South Atlantic Wreckfish Individual Transferable
Quota Program: This program was implemented in 1992 and is the only catch share program in the South Atlantic Region. This program was developed to create incentives for the conservation of wreckfish; provide a management regime that promotes stability and facilitates long-range planning and investment by harvesters and dealers; promote management regimes that minimize gear and area conflicts among fishermen; minimize the tendency for over-capitalization in the harvesting and processing/ distribution sectors; and provide a reasonable opportunity for fishermen to make adequate returns from commercial fishing by limiting entry into the program. NOAA Fisheries continues to collect data on this program to develop standard performance indicators that measure its basic economic performance.

## Policy Updates

Amendment 20B to the Coastal Migratory Pelagics FMP addressed issues associated with the boundaries between migratory groups, zones, and subzones; allocation of commercial annual catch limits; and modification of the framework procedure for management of king mackerel, Spanish mackerel, and cobia. Effective March 1, 2015, Amendment 20B specifically authorized the following items: 1) Eliminated the 500-pound trip limit that was effective when $75 \%$ of the respective quotas are landed for king mackerel in the Florida West Coast Northern and Southern subzones; 2) Changed the fishing year for king mackerel in the Florida West Coast Northern subzone from October to September beginning October 1, 2015; 3) Allowed transit of commercial vessels with king mackerel through areas closed to king mackerel fishing if gear is appropriately stowed; 4) Created Northern and Southern Zones for Atlantic migratory group king and Spanish mackerel with separate quotas for each; 4) Made administrative changes to the framework procedure for modifying management measures; 5) Increased annual catch limits and catch targets for cobia; and 6) Created a Florida East Coast Zone for cobia to adjust for differences between the SAFMC and GMFMC jurisdictional areas, and the biological distribution of the Gulf of Mexico and Atlantic stocks.

In 2016, the SAFMC approved the designation of five offshore areas as Spawning Special Management Zones (SMZs) through Amendment 36 to the Snapper-Grouper FMP to help protect spawning fish and unique habitat associated with spawning activities in the South Atlantic. This habitat includes portions of an elbow-shaped ledge off the coast of South Carolina and a deep sinkhole in the ocean floor just off the Florida Keys. Spawning SMZs are expected to protect important spawning habitat and associated species of fish within the SAFMC's snapper-grouper management complex by limiting specific fishing and anchoring activity within the sites. If approved by the Secretary of Commerce, the five areas, ranging in size from 3 to 5 square miles, would be the first such Spawning SMZs designated in federal waters off the South Atlantic coast.

## COMMERCIAL FISHERIES

In this report, commercial fisheries refer to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fisher-

## Landings Revenue: Largest Increases

From 2006:

- Swordfish (73\%,50\% in real terms)
- Oysters ( $72 \%, 49 \%$ in real terms)
- Blue crab (71\%, $48 \%$ in real terms)

From 2014:

- Clams (77\%)
- Flounders (9\%)
- Blue crab (4\%)

## Landings Revenue: Largest Decreases

From 2006:

- Groupers (-32\%, $-42 \%$ in real terms)
- King mackerels ( $-13 \%,-25 \%$ in real terms)
- Flounders ( $-4 \%,-17 \%$ in real terms)

From 2014:

- Tunas (-33\%)
- Swordfish (-18\%)
- Snappers (-9\%)
men. It also excludes the for hire sector, which earns its revenue from selling recreational fishing trips to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and ex-vessel prices of key species/species groups.

## Key South Atlantic Commercial Species

- Blue crab
- Oysters
- Clams
- Shrimp
- Flounders - Snappers
- Groupers • Swordfish
- King mackerels - Tunas

## Economic Impacts

The premise behind economic impact modeling is that every dollar spent in a regional economy (direct impact) is either saved or respent on additional goods or services. If those dollars are respent on other goods and services in the regional economy, this spending generates additional economic activity in the region. This report provides estimates of total economic impacts for the Nation and for each of the 23 coastal states. Total economic impacts for each state and the Nation represent the sum of direct impacts; indirect impacts (in this case, the impact from suppliers to the seafood industry); and induced impacts (spending by employees on personal and household ex-

## Landings: Largest Increases

From 2006:

- Swordfish (54\%)
- Oysters (30\%)
- Blue crab (10\%)

From 2014:

- Shrimp (45\%)
- Blue crab (18\%)
- Clams (14\%)

Landings: Largest Decreases
From 2006:

- Groupers (-56\%)
- King mackerels (-40\%)
- Flounders (-35\%)

From 2014:

- Tunas (-22\%)
- Swordfish (-12\%)
- Flounders (-12\%)
penditures, where employees of both seafood businesses and its full supply chain are included). That is, impacts from the seafood industry as well as the economic activity generated throughout each region's broader economy from this industry.

Four different measures are commonly used to show commercial fisheries landings affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as commercial fishing. It includes both the direct sales of fish landed and sales made between businesses and households resulting from the original sale. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported directly or indirectly by the sales of seafood or purchases of inputs to commercial fishing. The first three types of measures are calculated in terms of dollars, whereas employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. The United States seafood industry is defined here as the commercial fishing sector, seafood processors and deal-
ers, seafood wholesalers and distributors, importers, and seafood retailers. ${ }^{1,2}$

In 2015, commercial fishing in Florida generated the largest employment impacts in the South Atlantic Region with 79,700 jobs. Florida had the largest income impacts (\$3.3 billion), sales impacts ( $\$ 17.7$ billion), and value-added impacts ( $\$ 5.9$ billion).

The importers sector in Florida generated the highest employment impacts of any state-level sector with 41,500 jobs. The importers sector in Florida generated the highest state-level income impacts ( $\$ 2.1$ billion), the highest state-level sales impacts ( $\$ 12.8$ billion), and the highest state-level value-added impacts in the region ( $\$ 3.9$ billion).

## Landings Trends

Landings and landings revenue were flat from 2014 to 2015 in the South Atlantic Region, with shellfish gains largely offset by finfish losses. In particular, landings revenue from blue crab (up $\$ 1.6$ million) and clams (up \$3.1 million) increased in every state except South Carolina. Shrimp landings revenue increased $\$ 1.4$ million regionally from 2014 to 2015, with shrimp landings up in all states. The only state with an increase in landings revenue, however, was North Carolina (up \$4.4 million). Across the region, lower shrimp prices prevailed, reflecting the broader national trend in shrimp prices.

Regionally, tuna (down $\$ 1.1$ million) and swordfish (down $\$ 2.2$ million) had the largest declines in landings revenue from 2014 to 2015, which resulted from a combination of lower landings and lower prices.

## Landings Revenue

Landings revenue in the South Atlantic Region totaled \$182 million in 2015. This number represents a $29 \%$ increase from 2006 (a 12\% increase in real terms after adjusting for inflation) and remains unchanged from 2014. Landings revenue was highest in North Carolina ( $\$ 95$ million) followed by East Florida ( $\$ 49$ million). Shellfish landings revenue made up 66\% of total revenue. Shrimp ( $\$ 50$ million) and blue crab ( $\$ 46$ million) had the highest landings revenue in the South Atlantic Region in 2015. Together they accounted for $53 \%$ of total landings revenue.

From 2006 to 2015, swordfish (73\%, 50\% in real terms); oysters ( $72 \%, 49 \%$ in real terms); and blue crab ( $71 \%$, $48 \%$ in real terms) had the largest revenue increases, while groupers ( $-32 \%,-42 \%$ in real terms); king mackerels (-13\%, $-25 \%$ in real terms); and flounders ( $-4 \%,-17 \%$ in real terms) had the largest decreases. From 2014 to 2015, clams (77\%), flounders (9\%), and blue crab (4\%) had the largest revenue increases, while tunas (-33\%), swordfish ( $-18 \%$ ), and snappers ( $-9 \%$ ) had the largest decreases.

## Landings

In 2015, commercial fishermen in the South Atlantic Region landed more than 106 million pounds of finfish and shellfish, a 7\% decrease from 2006 and a 1\% increase from 2014. Landings volume was highest in North Carolina (66 million pounds), followed by East Florida ( 24 million pounds). Blue crab had the highest landings volume in the South Atlantic Region, accounting for 38\% of landed weight.

From 2006 to 2015, swordfish (54\%), oysters (30\%), and blue crab (10\%) had the largest landings increases, while groupers ( $-56 \%$ ), king mackerels ( $-40 \%$ ), and flounders $(-35 \%)$ had the largest decreases. From 2014 to 2015, shrimp (45\%), blue crab (18\%), and clams (14\%) had the largest landings increases, while tunas (-22\%), swordfish ( $-12 \%$ ), and flounders ( $-12 \%$ ) had the largest decreases.

## Price

In 2015, clams (\$9.65 per pound) received the highest ex-vessel price in the South Atlantic Region. Landings of blue crab ( $\$ 1.15$ per pound) had the lowest ex-vessel price. From 2006 to 2015, clams ( $57 \%$, $35 \%$ in real terms); blue crab (56\%, 35\% in real terms); and groupers ( $54 \%, 33 \%$ in real terms) had the largest price increases. There no decreases in price during this period. From 2014 to 2015, clams (55\%), flounders (23\%), and oysters (9\%) had the largest price increases, while shrimp ( $-29 \%$ ), tunas ( $-13 \%$ ), and blue crab ( $-13 \%$ ) had the largest decreases.

## RECREATIONAL FISHERIES

In this report, recreational fisheries refer to fishing for fun rather than to resell fish (commercial fishing) or for

[^68]
## Key South Atlantic Recreational Species

- Atlantic croaker and spot
- Black sea bass
- Bluefish
- Dolphinfish
- King mackerel
- Sharks
- Sheepshead porgy
- Red drum
- Spanish mackerel
- Spotted seatrout
subsistence. The recreational fisheries section reports on economic impacts and expenditures, angler participation, trips, and catch of key species/species groups.

## Economic Impacts and Expenditures

The contribution of recreational fishing activities ${ }^{3}$ in the United States is reported in terms of economic impacts from angler expenditures. Total annual trip expenditures are estimated by multiplying mean trip expenditures by the estimated number of adult trips in each trip mode (for-hire, private boat, and shore). Total annual durable expenditures are estimated by multiplying mean durable expenditures by the estimated annual number of adult participants in a given state.

Four different measures are commonly used to show how angler expenditures affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as recreational fishing. It includes both the direct sales made by the angler and sales made between businesses and households resulting from that original sale by the angler. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full- and part-time jobs supported directly or indirectly by the purchases made by anglers. The first three measures are calculated in terms of dollars, whereas employment impacts are measured in terms of number of jobs. Note that these categories are not additive. NOAA Fisheries uses a regional impact modeling software, called IMPLAN, to estimate these four types of impacts.

The greatest employment impacts from expenditures on saltwater recreational fishing in the South Atlantic Region

## Recreational Catch: Largest Increases

From 2006:

- Porgies (sheepshead) (47\%)
- Black sea bass (19\%)
- Red drum (10\%)

From 2014:

- Dolphinfish (49\%)
- Drum (Atlantic croaker and spot) (12\%)

## Recreational Catch: Largest Decreases

## From 2006:

- King mackerel (-72\%)
- Drum (spotted seatrout) (-25\%)
- Sharks (-12\%)

From 2014:

- Porgies (sheepshead) (-29\%)
- Black sea bass (-29\%)
- Red drum (-27\%)
were generated in East Florida (35,500 jobs), followed by North Carolina (14,200 jobs). The largest sales impacts were observed in East Florida (\$4 billion), followed by North Carolina ( $\$ 1.5$ billion). The biggest income impacts were generated in East Florida ( $\$ 1.5$ billion), followed by North Carolina (\$560 million). The greatest value-added impacts were in East Florida (\$2.4 billion), followed by North Carolina (\$871 million).

Recreational fishing expenditures (on both fishing trips and durable equipment purchases) across the South Atlantic Region in 2015 totaled about $\$ 5.3$ billion. Trip expenditures totaled more than $\$ 1$ billion, with a large portion coming from trips in the shore (46\%) and private boat (34\%) sectors. Durable goods expenditures totaled $\$ 4.3$ billion, with the largest portion coming from boat expenses ( $\$ 2.5$ billion).

## Fishing Trips

In 2015, recreational fishermen took 16.5 million fishing trips in the South Atlantic Region. This number was a 23\% decrease from 2006 and a 6\% decrease from 2014. The largest proportions of trips were taken in the shore mode (53\%) and private boat mode (44\%). States with the highest number of recorded trips were East Florida ( 8.6 million trips) and North Carolina ( 4.6 million trips).

[^69]
## Participation

In 2015, 2.2 million recreational anglers fished in the South Atlantic Region. This number was a $28 \%$ decrease from 2006 and a 18\% decrease from 2014. These anglers were South Atlantic Region residents from either a coastal county (79\%) or non-coastal county ( $21 \%$ ).

## Harvest and Release

Of the South Atlantic's key species and species groups, drum (Atlantic croaker and spot, 11.8 million fish), drum (spotted seatrout, 5.1 million fish), and bluefish ( 4.9 million fish) were most frequently caught by recreational fishermen. From 2006 to 2015, porgies (sheepshead, $47 \%$ ), black sea bass (19\%), and red drum ( $10 \%$ ) had the largest increases in catch, while king mackerel (-72\%), drum (spotted seatrout, -25\%), and sharks (-12\%). From 2014 and 2015, dolphinfish (49\%) and drum (Atlantic croaker and spot, 12\%) had the largest increases in catch, while porgies (sheepshead, -29\%), black sea bass (-29\%), and red drum (-27\%) had the largest decreases.

## MARINE ECONOMY

For this report, the marine economy refers to the economic activity generated by fishing and marine-related industries in a coastal state. The state marine economy consists of two industry sectors: 1) seafood sales and processing (employer establishments and non-employer firms); and 2) transport, support, and marine operations (employer establishments). These sectors include several different marine-related industries. Note that when discussing the marine economy in the South Atlantic Region, all statistics include the entire state of Florida and not just East Florida. ${ }^{4,5,6}$

To measure the size of the commercial fishing sector in a state's economy relative to the size of the commercial fishing sector in the national economy, researchers use an index called the Commercial Fishing Location Quotient (CFLQ). ${ }^{7}$ The CFLQ is calculated as the ratio of the percentage of regional employment in the commercial fishing sector relative to the percentage of national employment in the commercial fishing sector. The U.S. CFLQ is 1 . If a state's CFLQ is less than 1 , then less commercial fishing occurs in this state than the national
average. If a state's CFLQ is greater than 1 , then more commercial fishing occurs in this state than the national average.

In 2014, the CFLQ for Florida was the highest in the region at 1.01 . Florida's CFLQ suggests that the level of employment in industries related to commercial fishing in this state is approximately 1.01 times higher than the level of employment in these industries nationwide. In 2014, 1.1 million establishments operated throughout the South Atlantic Region, including marine and non-marine-related establishments. These establishments employed 16 million workers and had a total annual payroll of $\$ 695$ billion. The region's gross domestic product was approximately $\$ 2$ trillion in 2014.

## Seafood Sales and Processing

Seafood Product Preparation and Packaging: In 2014, there were 468 non-employer firms (a 100\% increase from 2006) and annual receipts totaled $\$ 35$ million (a 111\% increase from 2006 in real terms). The greatest number of firms was located in Florida (315).

There were 52 employer establishments (a $2 \%$ increase from 2006) in 2014. These establishments employed approximately 2,442 workers (a $27 \%$ decrease from 2006) and had a total annual payroll of $\$ 92$ million (a $32 \%$ decrease from 2006 in real terms). The greatest number of establishments was located in Florida (27).

Seafood Sales, Retail: In 2014, there were 659 non-employer firms (a 27\% increase from 2006) and annual receipts totaled $\$ 54$ million (an $11 \%$ increase from 2006 in real terms). The greatest number of firms was located in Florida (137).

There were 377 employer establishments (a $1 \%$ decrease from 2006) in 2014. These establishments employed 1,768 workers (a 13\% increase from 2006) and had a total annual payroll of $\$ 39$ million (an $18 \%$ increase from 2006 in real terms). The greatest number of establishments was located in Florida (166).

Seafood Sales, Wholesale: There were 325 establishments (a 14\% decrease from 2006) in 2014. These establishments employed 3,880 workers (a 10\% increase from 2006) and had a total annual payroll of

[^70]$\$ 144$ million (a $1 \%$ decrease from 2006 in real terms). The greatest number of establishments was located in Florida (233).

Transport, Support, and Marine

## Operations

The size of the Transport, Support, and Marine Operations sectors in the South Atlantic Region is difficult to assess because much of the state-level data is suppressed for confidentiality purposes. It is clear, however, that these sectors play an important role in the regional economy. For example, the Ship and Boat Building sector contributed over 12,000 jobs and more than \$600 million in payroll in Florida, South Carolina, and North Carolina alone.

## Tables | South Atlantic Region

South Atlantic Region | Commercial Fisheries

## Gulf of Mexico Region

## - Alabama <br> - West Florida <br> - Louisiana <br> - Mississippi <br> - Texas

## MANAGEMENT CONTEXT

The Gulf of Mexico Region includes Alabama, Louisiana, Mississippi, Texas, and West Florida. Federal fisheries in this region are managed by the Gulf of Mexico Fishery Management Council (GMFMC) and NOAA Fisheries under seven fishery management plans (FMPs). The coastal migratory pelagic resources and spiny lobster fisheries are managed jointly with the South Atlantic Fishery Management Council (SAFMC).

## FMPs in the Gulf of Mexico Region

- Aquaculture
- Coastal migratory pelagic resources (with SAFMC)
- Corals
- Red drum
- Reef fish
- Shrimp
- Spiny lobster (with SAFMC)

Three stocks or stock complexes in the Gulf of Mexico Region were identified as overfished in 2015: gray triggerfish, greater amberjack, and red snapper.

## Catch Share Programs

Two catch share programs have been implemented in the Gulf of Mexico: the Red Snapper Individual Fishing Quota (IFQ) Program and the Grouper-Tilefish IFQ Program. Following are descriptions of these catch share programs and their performance.

Red Snapper IFQ Program: This program was implemented in 2007 to reduce overcapacity and mitigate derby fishing conditions in the red snapper segment of the commercial reef fish fishery. The key performance indicators of this program show that relative to the baseline period (the 3-year period prior to implementation), the 2014 quota, landings, inflation-adjusted total revenue, and inflation-adjusted total revenue per vessel increased. In contrast, the number of active vessels has decreased since the implementation of the IFQ Program.

Grouper-Tilefish IFQ Program: This program was implemented in 2010 to reduce overcapacity, increase harvesting efficiency, and eliminate the race to fish in the grouper-tilefish segment of the commercial reef fish fishery. The key performance indicators of this program generally show that relative to the baseline period (the 3-year period prior to implementation), 2014 landings,
inflation-adjusted total revenue, and inflation-adjusted revenue per active vessel increased. However, overall quota and the number of active vessels decreased during this period.

## Policy Updates

In January 2016, NOAA Fisheries published a final rule for the GMFMC Aquaculture Plan for Federal Waters of the Gulf of Mexico. The plan established a regional permitting process to manage the development of an environmentally and economically sustainable aquaculture fishery in federal waters. Before the plan was implemented, exempted fishing permits were required to conduct aquaculture in federal waters. However, these exempted fishing permits were not good investments for commercial aquaculture operations because of their limited duration. No more than 20 Gulf aquaculture permits can be issued under this final rule.

Also in 2016, the GMFMC approved Amendment 28 to the FMP for the Reef Fish Resources of the Gulf of Mexico. The amendment reallocated the red snapper harvest consistent with the updated 2014 red snapper population assessment to ensure the allowable catch and recovery benefits from a rebuilding population were fairly and equitably allocated between commercial and recreational anglers. The amendment reallocated the red snapper stock annual catch limit between the commercial and recreational sectors from 51\%:49\% to 48.5\%:51.5\%, respectively.

## COMMERCIAL FISHERIES

In this report, commercial fisheries refer to fishing operations that sell their catch for profit. It does not include saltwater anglers that fish for sport or subsistence fishermen. It also excludes the for hire sector, which earns its revenue from selling recreational fishing trips to saltwater anglers. The commercial fisheries section reports on economic impacts, landings revenue, landings, and ex-vessel prices of key species/species groups.

## Economic Impacts

The premise behind economic impact modeling is that every dollar spent in a regional economy (direct impact) is either saved or respent on additional goods or services. If those dollars are respent on other goods and services

## Key Gulf of Mexico Region Commercial Species

- Blue crab
- Crawfish
- Groupers
- Menhaden
- Mullets
- Oysters
- Red snapper
- Shrimp
- Spiny lobster
- Tunas
in the regional economy, this spending generates additional economic activity in the region. This report provides estimates of total economic impacts for the Nation and for each of the 23 coastal states. Total economic impacts for each state and the Nation represent the sum of direct impacts; indirect impacts (in this case, the impact from suppliers to the seafood industry); and induced impacts (spending by employees on personal and household expenditures, where employees of both seafood businesses and its full supply chain are included). That is, impacts from the seafood industry as well as the economic activity generated throughout each region's broader economy from this industry.

Four different measures are commonly used to show commercial fisheries landings affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales

## Landings Revenue: Largest Increases

From 2006:

- Crawfish ( $431 \%, 359 \%$ in real terms)
- Menhaden ( $208 \%, 166 \%$ in real terms)
- Red snapper (108\%, $80 \%$ in real terms)

From 2014:

- Menhaden (72\%)
- Red snapper (19\%)
- Oysters (7\%)

## Landings Revenue: Largest Decreases

From 2006:

- Tunas ( $-47 \%,-54 \%$ in real terms)
- Mullets ( $-28 \%,-38 \%$ in real terms)
- Shrimp ( $-12 \%,-24 \%$ in real terms)

From 2014:

- Crawfish (-57\%)
- Shrimp (-41\%)
- Mullets (-34\%)
by regional businesses affected by an activity, such as commercial fishing. It includes both the direct sales of fish landed and sales made between businesses and households resulting from the original sale. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on the basis of full-time and part-time jobs supported directly or indirectly by the sales of seafood or purchases of inputs to commercial fishing. The first three types of measures are calculated in terms of dollars, whereas employment impacts are measured in terms of numbers of jobs. Note that these categories are not additive. The United States seafood industry is defined here as the commercial fishing sector, seafood processors and dealers, seafood wholesalers and distributors, importers, and seafood retailers. ${ }^{1,2}$

In 2015, commercial fishing in Florida generated the largest employment impacts in the Gulf of Mexico Region with 79,700 jobs. Florida had the largest income impacts (\$3.3 billion), sales impacts ( $\$ 17.7$ billion), and value-added impacts ( $\$ 5.9$ billion).

The importers sector in Florida generated the highest employment impacts of any state-level sector (41,500

## Landings: Largest Increases

From 2006:

- Crawfish (272\%)
- Red snapper (45\%)
- Menhaden (32\%)

From 2014:

- Menhaden (40\%)
- Red snapper (18\%)
- Spiny lobster (10\%)

## Landings: Largest Decreases

From 2006:

- Tunas (-53\%)
- Shrimp (-30\%)
- Mullets (-24\%)

From 2014:

- Crawfish (-58\%)
- Mullets (-29\%)
- Tunas (-24\%)

[^83]jobs). The importers sector in Florida generated the highest state-level income impacts ( $\$ 2.1$ billion), the highest state-level sales impacts ( $\$ 12.8$ billion), and the highest state-level value-added impacts in the region (\$3.9 billion).

## Landings Trends

Landings revenue declined from $\$ 1.1$ billion in 2014 to $\$ 858$ million in 2015 largely due to shellfish landings revenue losses (down $\$ 246$ million), which were only partially offset by finfish revenue gains (up $\$ 54$ million). Regionally, shellfish landings revenues were down almost across the board: shrimp, down $\$ 238$ million; blue crab, down $\$ 5.1$ million; crawfish, down $\$ 9.2$ million; and spiny lobster, down $\$ 8.0$ million. While the decline in shrimp landings revenue was somewhat attributable to lower landings ( $-6 \%$ ), the major driver was lower prices, which fell $37 \%$ from the previous year. Market reports identified high inventories as a key factor in driving prices of both domestically harvested shrimp and shrimp imports lower. In addition, 2014 shrimp prices were the highest since 2000 due to a number of factors, including the disruption in the Asian market due to the spread of "early mortality syndrome: (EMS), a bacteria that causes early death in shrimp. A comparison of the 2015 shrimp price to the average price from the previous five years indicates prices were $22 \%$ lower in 2015 relative to that period.

Lower blue crab landings revenue in 2015 relative to 2014 also reflects the fact that 2014 was a banner year for blue crab - garnering the highest landings revenue and price on record in both nominal and real terms. While 2015 blue crab landings revenue was indeed lower than 2014, it was still a good year relative to the average landings revenue from the previous five years - in 2015, blue crab landings revenue were up $31 \%$ relative to the preceding five year average.

## Landings Revenue

Landings revenue in the Gulf Region totaled $\$ 858$ million in 2015. This number represents a $24 \%$ increase from 2006 (a 7\% increase in real terms after adjusting for inflation) and an 18\% decrease from 2014. Landings revenue was highest in Louisiana ( $\$ 374$ million) fol-
lowed by West Florida (\$192 million). Shellfish landings revenue made up $71 \%$ of total revenue. Shrimp (\$348 million) and menhaden ( $\$ 139$ million) had the highest landings revenue in the Gulf of Mexico Region in 2015. Together they accounted for $57 \%$ of total landings revenue.
From 2006 to 2015, crawfish ( $431 \%, 359 \%$ in real terms); menhaden (208\%, 166\% in real terms); and red snapper ( $108 \%, 80 \%$ in real terms) had the largest revenue increases, while tunas ( $-47 \%,-54 \%$ in real terms); mullets ( $-28 \%,-38 \%$ in real terms); and shrimp ( $-12 \%,-24 \%$ in real terms) had the largest decreases. From 2014 to 2015, menhaden (72\%), red snapper (19\%), and oysters (7\%) had the largest revenue increases, while crawfish ( $-57 \%$ ), shrimp ( $-41 \%$ ), and mullets ( $-34 \%$ ) had the largest decreases.

## Landings

In 2015, commercial fishermen in the Gulf Region landed 1.6 billion pounds of finfish and shellfish, a $14 \%$ increase from 2006 and a 25\% increase from 2014. Landings volume was highest in Louisiana (1 billion pounds), followed by Mississippi ( 306 million pounds). Menhaden had the highest landings volume in the Gulf of Mexico Region, accounting for $76 \%$ of landed weight.

From 2006 to 2015, crawfish (272\%), red snapper ( $45 \%$ ), and menhaden ( $32 \%$ ) had the largest landings increases, while tunas (-53\%), shrimp ( $-30 \%$ ), and mullets (-24\%) had the largest decreases. From 2014 to 2015, menhaden (40\%), red snapper (18\%), and spiny lobster (10\%) had the largest landings increases, while crawfish ( $-58 \%$ ), mullets ( $-29 \%$ ), and tunas (-24\%) had the largest decreases.

## Price

In 2015, spiny lobster ( $\$ 8.06$ per pound) received the highest ex-vessel price in the Gulf of Mexico Region. Landings of menhaden ( $\$ 0.12$ per pound) had the lowest ex-vessel price. From 2006 to 2015, menhaden ( $134 \%, 102 \%$ in real terms); blue crab ( $121 \%, 91 \%$ in real terms); and oysters (83\%, 58\% in real terms) had the largest price increases, while mullets ( $-6 \%,-18 \%$ in real terms) had the largest decrease. From 2014 to 2015, menhaden (23\%), oysters (12\%), and groupers
(5\%) had the largest price increases, while shrimp ( $-37 \%$ ), spiny lobster ( $-24 \%$ ), and blue crab ( $-8 \%$ ) had the largest decreases.

## RECREATIONAL FISHERIES

In this report, recreational fisheries refer to fishing for fun rather than to resell fish (commercial fishing) or for subsistence. The recreational fisheries section reports on economic impacts and expenditures, angler participation, trips, and catch of key species/species groups.

## Key Gulf of Mexico Region Recreational Species

- Atlantic croaker
- Sheepshead porgy
- Southern flounder
- Spanish mackerel

Gulf and southern kingfish

- Red drum
- Red snapper
- Sand and silver seatrout
- Spotted seatrout
- Striped mullet

## Economic Impacts and Expenditures

The contribution of recreational fishing activities ${ }^{3}$ in the United States is reported in terms of economic impacts from angler expenditures. Total annual trip expenditures are estimated by multiplying mean trip expenditures by the estimated number of adult trips in each trip mode (for-hire, private boat, and shore). Total annual durable expenditures are estimated by multiplying mean durable expenditures by the estimated annual number of adult participants in a given state.

Four different measures are commonly used to show how angler expenditures affect the economy in a region (state or nationwide): sales, income, value-added, and employment. Sales refer to the gross value of all sales by regional businesses affected by an activity, such as recreational fishing. It includes both the direct sales made by the angler and sales made between businesses and households resulting from that original sale by the angler. Income includes personal income (wages and salaries) and proprietors' income (income from self-employment). Value-added is the contribution made to the gross domestic product in a region. Employment is specified on

## Recreational Catch: Largest Increases

From 2006:

- Striped mullet (62\%)
- Porgies (sheepshead) (7\%)
- Drum (sand and silver seatrouts) (1\%)

From 2014:

- Drum (Gulf and southern kingfish) (33\%)
- Drum (sand and silver seatrouts) (22\%)
- Drum (spotted seatrout) (14\%)

## Recreational Catch: Largest Decreases

From 2006:

- Drum (spotted seatrout) (-51\%)
- Red snapper (-39\%)
- Spanish mackerel (-36\%)

From 2014:

- Spanish mackerel (-34\%)
- Drum (Atlantic croaker) (-29\%)
- Striped mullet (-24\%)
the basis of full- and part-time jobs supported directly or indirectly by the purchases made by anglers. The first three measures are calculated in terms of dollars, whereas employment impacts are measured in terms of number of jobs. Note that these categories are not additive. NOAA Fisheries uses a regional impact modeling software, called IMPLAN, to estimate these four types of impacts.

The greatest employment impacts from expenditures on saltwater recreational fishing in the Gulf of Mexico Region were generated in West Florida ( 61,300 jobs), followed by Texas (15,400 jobs). The largest sales impacts were observed in West Florida ( $\$ 6.9$ billion), followed by Texas ( $\$ 1.9$ billion). The biggest income impacts were generated in West Florida ( $\$ 2.6$ billion), followed by Texas (\$726 million). The greatest value-added impacts were in West Florida ( $\$ 4.2$ billion), followed by Texas ( $\$ 1.2$ billion).

Recreational fishing expenditures (on both fishing trips and durable equipment purchases) across the Gulf of Mexico Region in 2015 totaled about $\$ 10.4$ billion. Trip expenditures totaled more than $\$ 1.4$ billion, with a large portion coming from trips in the private boat (41\%) and for-hire (30\%) sectors. Durable goods expenditures to-

[^84]taled $\$ 9$ billion, with the largest portion coming from boat expenses ( $\$ 5.2$ billion).

## Fishing Trips

In 2015, recreational fishermen took 19.7 million fishing trips in the Gulf of Mexico Region. This number was a $15 \%$ decrease from 2006 and a 6\% decrease from 2014. The largest proportions of trips were taken in the private boat mode (56\%) and shore mode (39\%). States with the highest number of recorded trips were West Florida ( 13.4 million trips) and Louisiana (2.4 million trips).

## Participation

In 2015, 2.5 million recreational anglers fished in the Gulf of Mexico Region. This number was a $31 \%$ decrease from 2006 and a 13\% decrease from 2014. These anglers were Gulf of Mexico Region residents from either a coastal county ( $90 \%$ ) or non-coastal county (10\%).

## Harvest and Release

Of the Gulf of Mexico's key species and species groups, drum (spotted seatrout, 16.9 million fish), red drum ( 6.2 million fish), and drum (sand and silver seatrouts, 3.8 million fish) were most frequently caught by recreational anglers. From 2006 to 2015, striped mullet (62\%); porgies (sheepshead, 7\%); and drum (sand and silver seatrouts, 1\%) had the largest increases in catch, while drum (spotted seatrout, -51\%); red snapper (-39\%); and Spanish mackerel (-36\%) had the largest decreases. From 2014 to 2015, drum (Gulf and southern kingfish, 33\%); drum (sand and silver seatrouts, 22\%); and drum (spotted seatrout, 14\%) had the largest increases in catch, while Spanish mackerel (-34\%); drum (Atlantic croaker, -29\%); and striped mullet (-24\%) had the largest decreases.

## MARINE ECONOMY

For this report, the marine economy refers to the economic activity generated by fishing and marine-related industries in a coastal state. The state marine economy consists of two industry sectors: 1) seafood sales and processing (employer establishments and non-employer firms); and 2) transport, support, and marine opera-
tions (employer establishments). These sectors include several different marine-related industries. Note that when discussing the marine economy in the Gulf of Mexico Region, all statistics include the entire state of Florida and not just West Florida. ${ }^{4,5,6}$

To measure the size of the commercial fishing sector in a state's economy relative to the size of the commercial fishing sector in the national economy, researchers use an index called the Commercial Fishing Location Quotient (CFLQ). ${ }^{7}$ The CFLQ is calculated as the ratio of the percentage of regional employment in the commercial fishing sector relative to the percentage of national employment in the commercial fishing sector. The U.S. CFLQ is 1 . If a state's CFLQ is less than 1, then less commercial fishing occurs in this state than the national average. If a state's CFLQ is greater than 1, then more commercial fishing occurs in this state than the national average.

In 2014, the CFLQ for Louisiana was the highest in the region at 2.14. Louisiana's CFLQ suggests that the level of employment in industries related to commercial fishing in this state is approximately 2.14 times higher than the level of employment in these industries nationwide.

In 2014, 1.3 million establishments operated throughout the Gulf of Mexico Region, including marine and non-marine-related establishments. These establishments employed 22 million workers and had a total annual payroll of $\$ 988$ billion. The region's gross domestic product was approximately $\$ 3$ trillion in 2014.

## Seafood Sales and Processing

Seafood Product Preparation and Packaging: In 2014, there were 632 non-employer firms (a 44\% increase from 2006) and annual receipts totaled $\$ 43$ million (a 54\% increase from 2006 in real terms). The greatest number of firms was located in Florida (315). There were 138 employer establishments (a $5 \%$ increase from 2006) in 2014. These establishments employed approximately 6,676 workers (a $29 \%$ decrease from 2006) and had a total annual payroll of $\$ 211$ million (a 19\% decrease from 2006 in real terms). The greatest number of establishments was located in Louisiana (37).

[^85]Seafood Sales, Retail: In 2014, there were 819
non-employer firms (a 20\% increase from 2006) and annual receipts totaled $\$ 66$ million (a $15 \%$ decrease from 2006 in real terms). The greatest number of firms was located in Florida (346).

There were 356 employer establishments (a $4 \%$ decrease from 2006) in 2014. These establishments employed 2,194 workers (a 13\% increase from 2006) and had a total annual payroll of $\$ 48$ million (a $24 \%$ increase from 2006 in real terms). The greatest number of establishments was located in Florida (166).

Seafood Sales, Wholesale: There were 463 establishments (a 10\% decrease from 2006) in 2014. These establishments employed 3,850 workers (a 9\% decrease from 2006) and had a total annual payroll of $\$ 155$ million (a $2 \%$ increase from 2006 in real terms). The greatest number of establishments was located in Florida (233).

## Transport, Support, and Marine

## Operations

The size of the Transport, Support, and Marine Operations sectors in the Gulf of Mexico Region is difficult to assess because much of the state-level data is suppressed for confidentiality purposes. It is clear, however, that these sectors play an important role in the regional economy. For example, the Ship and Boat Building sector contributed over 12,000 jobs and more than \$600 million in payroll in Alabama, Florida, Louisiana, and Texas alone (data for Mississippi are suppressed). The Coastal Freight Transportation sector contributed over $\$ 960$ million in payroll to the region, mainly in Louisiana, Texas, and Florida.

## Glossary

Angler ${ }^{1}$ - A person catching fish or shellfish with no intent to sell, including people releasing the catch. Also known as a recreational fisherman.

Annual Payroll ${ }^{2}$ - Includes all forms of compensation such as salaries, wages, reported tips, commissions, bonuses, vacation allowances, sick-leave pay, employee contributions to qualified pension plans, and the value of taxable fringe benefits. For corporations, it includes amounts paid to officers and executives; for unincorporated businesses, it does not include profit or other compensation of proprietors or partners. Payroll is reported before deductions for Social Security, income tax, insurance union dues, etc.

Annual Receipts ${ }^{3}$ - Includes gross receipts, sales, commissions, and income from trades and businesses, as reported on annual business income tax returns. Business income consists of all payments received for services rendered by nonemployer businesses, such as payments received as independent agents and contractors. The composition of nonemployer receipts may differ from receipts data published for employer establishments. For example, for wholesale agents and brokers without payroll (nonemployers), the receipts item contains commissions or earnings. In contrast, for wholesale agents and brokers with payroll (employers), the sales and receipts item published in the Economic Census represents the value of the goods involved in the transactions.

Buyback Program ${ }^{4}$ - A management tool available to fishery managers intended to ease fishing-related pressure on marine resources. Fishing vessels are purchased by the government or by the fishing industry itself. Then they are removed from a specific fishery where fish stocks or stock complexes are considered overfished or subject to overfishing.

Bycatch ${ }^{1}$ - Species other than the primary target species that are caught incidental to the harvest of the primary species. Bycatch may be retained or discarded; discards may occur for regulatory or economic reasons.

Catch ${ }^{1}$ - 1. To undertake any activity that results in taking fish out of its environment dead or alive, or to bring fish on board a vessel dead or alive; 2. The total number (or weight) of fish caught by fishing operations. Catch should include all fish killed by the act of fishing, not just those landed; 3. The component of fish encountering fishing gear, which is retained by the gear. Catch is usually expressed in terms of wet weight. It refers sometimes to the total amount caught and sometimes only to the amount landed. The fish that are not landed, but returned to the sea, are called discards or bycatch. For this report, recreational catch refers to the total number of individual fish released (thrown back into the sea) and harvested (not thrown back into the sea) by recreational fishermen (anglers).

Catch Share Program ${ }^{5}$ - This is a generic term used to describe a fishery management program that allocates a specific portion of the total fishery catch to individuals, cooperatives, communities or other entities, including sectors. The term encompasses more specific programs defined in legislation such as Limited Access Privilege Programs (LAPPs) and Individual Fishing Quotas (IFQs). Note that a catch share allocated to a sector is different from a general sectoral allocation or distribution to an entire segment of a fishery (such as a recreational sector allocation or a longline gear sector allocation). The two differ because the recipient of the catch share is responsible for terminating fishing activity when their specific share is reached.

Coastal County ${ }^{6}$ - A coastal county meets one of the following criteria: 1) at least 15 percent of a county's total land area is located within the nation's coastal watershed; 2) a portion of or an entire county accounts for at least 15 percent of a coastal cataloging unit. Any U.S. county that meets these criteria is classified as coastal.

Coastal County Angler - For this report, a coastal county angler refers to a recreational fishermen who lives within a given state and within a coastal county of that state.

Commercial Fishing Location Quotient (CFLQ) ${ }^{7}$ - For this report, the CFLQ is calculated as the ratio of a state's distribution of employment in commercial fishing industries compared with the distribution of commercial fishing industries in the U.S. The CFLQ is calculated using the "Location Quotient Calculator" provided by the Bureau of Labor Statistics, U.S. Department of Labor.

Community Development Quota Program (CDQ) ${ }^{1}$ - A program in western Alaska under which a percentage of the total allowable catch (TAC) of Bering Sea commercial fisheries is allocated to specific communities. Communities eligible for this program must be located within 50 miles of the Bering Sea coast or on an island within the Bering Sea; meet criteria established by the State of Alaska; be a village certified by the Secretary of the Interior pursuant to the Alaska Native Claims Settlement Act; and consist of residents who conduct more than half of their current commercial or subsistence fishing in the Bering Sea or waters surrounding the Aleutian Islands. Currently 7.5 percent of the TAC in the pollock, halibut, sablefish, crab and groundfish fisheries is allocated to the CDQ Program.

Dedicated Access Privileges (DAPs) ${ }^{8}$ - As defined by the U.S. Commission on Ocean Policy, a DAP program assigns an individual or other entity access to a pre-determined portion of the annual catch in a particular fishery. In some cases, the privilege is transferable and may be bought and sold, creating a market. The term encompasses a range of tools, including access privileges assigned to individuals (that is, individual transferable quotas), and to groups or communities (for example, community development quotas, cooperatives, and area-based quotas). DAP programs are sometimes known as rights-based management, and are of 10 synonymous with Limited Access Privilege Programs (see "Limited Access Privilege Program"). However, "rights-based management" implies granting an individual the "right" to fish. With the exception of certain tribes, U.S. fishermen do not have inalienable rights to fish because the fishery resources of the U.S. belong to all people of the U.S. Under current law, fishermen are granted a "privilege" to fish, subject to certain conditions.

Discards ${ }^{1}$ - To release or return a fish or other species to the sea, dead or alive, whether or not such fish or other species are brought fully on board a fishing vessel. Estimates of discards can be made in a variety of ways, including samples from observers and logbook records. Fish (or parts of fish) can be discarded for a variety of reasons such as having physical damage, being a non-target species for the trip, and compliance with management regulations like minimum size limits or quotas.

Durable Equipment Expenditures or Durable Goods Expenditures ${ }^{9}$ - For this report, this term refers to expenses related to equipment used for recreational fishing activities. These expenses include the purchase of semi-durable goods (tackle, rods, reels, line, etc.); durable goods (motor boats and accessories, non-motorized boats, boating electronics, mooring, boat storage, boat insurance, and vehicles or homes); and angling accessories and multi-purpose items (magazines, club dues, saltwater angling-specific clothing, and camping gear).

Ecolabel or Ecolabelling Scheme ${ }^{10}$ - In fisheries, ecolabelling schemes entitle a fishery product to bear a distinctive logo or statement that certifies that the fish has been harvested in compliance with specified conservation and sustainability standards. The logo or statement is intended to facilitate informed decisions by purchasers whose choices may promote and stimulate the sustainable use of fishery resources.

Economic Impact Model ${ }^{9,11}$ - Economic impact models capture how sales in a sector generate economic impacts directly in the sector in which the sale was made. The sales then ripple throughout the state and national economies as each dollar spent generates additional sales by other firms and consumers. The NOAA Fisheries Commercial Fishing \& Seafood Industry Input/Output Model uses an IMPLAN platform to estimate the economic impacts associated with the harvesting of fish by U.S. commercial fishermen and other major components of the U.S. seafood industry. As used here, the term fish refers to the entire range of finfish, shellfish and other life (that is, sea urchins, seaweed, kelp and worms) from marine and freshwaters that are included in the landings data maintained by the National Marine Fisheries Service. The NOAA Fisheries Recreational Economic Impact Model, which also uses an IMPLAN platform, estimates the economic impacts generated by expenditures made by saltwater anglers.

Economic Impacts ${ }^{9,11}$ - For this report, the economic impacts of the commercial fishing sector and seafood industry refer to the employment (full-time and part-time jobs), personal income, and output (sales by U.S. businesses) generated by the commercial harvest sector and other major components of the U.S. seafood industry. These components include processors and dealers, wholesalers and distributors, grocers, and restaurants. Economic impacts of recreational fishing activities refer to the amount of sales generated, the number of jobs supported, and the contribution to gross domestic product (GDP) by state (also known as value-added impacts) from expenditures related to recreational fishing.

Effort ${ }^{1}$ - For this report, effort refers to the number of fishing trips taken by recreational fishermen (anglers). The term can also refer to the amount of time and fishing power used to harvest fish in commercial fisheries, including gear size, boat size and horsepower.

Employee Compensation ${ }^{12}$ - This is related to Gross Domestic Product (GDP) by State and is an estimate of the sum of employee wages and salaries and supplements to wages and salaries. Wages and salaries are measured on an accrual, or "when earned" basis, which may be different from the measure of wages and salaries measured on a disbursement, or "when paid" basis. Wages and salaries and supplements of Federal military and civilian government employees stationed abroad are excluded from the measure of GDP by state.

Employer Establishments ${ }^{13}$ - Businesses with payroll and paid employees with a single physical location at which business is conducted or services or industrial operations are performed. An employee establishment is not necessarily identical to a company or enterprise, which may consist of one or more establishments. When two or more activities are carried on at a single location under a single ownership, all activities generally are grouped together as a single establishment. The entire establishment is classified on the basis of its major activity, and all data are included in that classification.

Endangered Species ${ }^{14}$ - As defined by the Endangered Species Act (ESA), an endangered species is any species which is in danger of extinction throughout all or a significant portion of its range. See also "Threatened Species."

Endangered Species Act (ESA) ${ }^{14}$ - The ESA was signed on December 28, 1973, and provides for the conservation of species that are endangered or threatened throughout all or a significant portion of their range, and the conservation of the ecosystems on which they depend. The ESA replaced the Endangered Species Conservation Act of 1969. Congress has amended the ESA several times.

Expenditures ${ }^{9}$ - For this report, expenditures are related to recreational fishing activities and described as being one of two types: 1) expenditures related to a specific fishing trip; or 2) durable equipment expenditures.

Ex-Vessel ${ }^{10}$ - Refers to activities that occur when a commercial fishing boat lands or unloads a catch. For example, the price for the catch that a captain receives at the point of landing is an ex-vessel price.

Exclusive Economic Zone (EEZ) ${ }^{1}$ - The EEZ is the area that extends 200 nautical miles from the seaward boundaries of the coastal states. The seaward boundary for most states is 3 nautical miles with the exceptions of Texas, Puerto Rico and the Gulf Coast of Florida, which is 9 nautical miles. The U.S. claims and exercises sovereign rights and exclusive fishery management authority over all fish and continental shelf resources through this 200-nautical-mile boundary.

Fish Stock ${ }^{1}$ - A fish stock refers to the living resources in the community or population from which catches are taken in a fishery. The term "fish stock" usually implies that the particular population is more or less isolated from other stocks of the same species and hence self-sustaining. In a particular fishery, the fish stock may be one or several species of fish. Here, it also includes commercial invertebrates and plants.

Fishery Management Council (FMC) or Regional Fishery Management Councill ${ }^{4}$ - A regional fisheries management body established by the Magnuson-Stevens Act to manage fishery resources in eight designated regions of the United States.

Fishery Management Plan (FMP) ${ }^{4}$ - 1. A document prepared under supervision of the appropriate fishery management council (FMC) for management of stocks of fish judged to require management. The plan must generally be formally approved. An FMP includes data, analyses and management measures; 2. A plan containing conservation and management measures for fishery resources, and other provisions required by the Magnuson-Stevens Act, developed by fishery management councils or the Secretary of Commerce.

Fishing Cooperatives ${ }^{4}$ - A market-based fisheries management tool where access to fisheries resources is limited to a specific group of fishermen. See also "Catch Share Progam."

Fishing Day - For this report, a fishing day refers to a partial or full day spent in recreational fishing and can be different from a fishing trip. For example, one fishing trip can consist of more than 1 fishing day. This term is used in the Alaska recreational fishing tables.

Fishing Effort ${ }^{10}$ - The amount of fishing gear of a specific type used on the fishing grounds over a given unit of time. For example, hours trawled per day, number of hooks set per day, or number of hauls of a beach seine per day. When two or more kinds of gear are used, the respective efforts must be adjusted to some standard type before being added. For recreational fishing activities, fishing effort refers to the number of participants (that is, recreational fishermen or anglers) who engage in recreational fishing activities.

Fishing Mode - For this report, fishing mode refers to the type of recreational fishing a recreational fisherman (angler) engages in, such as fishing from shore, a private or rental boat, or a for-hire boat.

Fishing Trip - For this report, a fishing trip refers to a recreational fishing excursion and can be different from a fishing day. For example, one fishing trip can consist of more than 1 fishing day. Fishing trips are classified as occurring in one of three fishing modes: 1) a shore-based fishing trip; 2) by a private or rental boat; or 3) on a for-hire fishing boat.

For-Hire Mode - For this report, this fishing mode refers to trips taken by a recreational fishermen (angler) on a party (also referred to as a headboat) or charter boat.

Gross Domestic Product (GDP) by State or Gross State Product (GSP) ${ }^{12}$ - Previously known as the Gross State Product, the GDP by state is the value added in production by the labor and capital located in a state. GDP for a state is derived as the sum of the GDP originating in all industries in the state.

Harvest ${ }^{1}$ - The total number of weight or fish caught and kept from an area over a period of time. Note that landings, catch and harvest are different. For recreational fishing activities, harvest refers to the number of individual fish not thrown back into the sea by a recreational fishermann (angler). However, in Hawaiti and the Gulf states, harvest includes fish thrown back dead. See also "Catch" and "Release."

Individual Fishing Quota (IFQ) ${ }^{1}$ - A type of limited entry; an allocation to an individual (a person or a legal entity, for example, a vessel owner or company) of a right (privilege) to harvest a certain amount of fish in a certain period of time. It is also of 10 expressed as an individual share of an aggregate quota, or total allowable catch (TAC). See also "Individual Transferable Quota" and "Catch Share Program."

Individual Transferable Quota (ITQ) ${ }^{1}$ - A type of individual fishing quota (IFQ) allocated to individual fishermen or vessel owners that can be transferred (sold or leased) to others. See also "Individual Fishing Quota."

Industry Sector - For this report, fishing- and marine-related industries were combined into industry sectors. Two industry sectors were included in this report: 1) seafood sales and processing; and 2) transport, support and marine operations. Fishing and marine-related industries were chosen from the County Business Patterns Data Series based on data availability and perceived relevance to fishing or marine activities. These industries were then combined into one of these two industry sectors.

Key Species or Species Groups - For this report, up to 10 species or species groups were chosen as "key" species or species groups due to their regional importance to commercial and recreational fisheries. The regional importance of these key species or species groups was chosen based on their economic and/or historical significance to a state or region.

Landings ${ }^{1}-1$. The number or poundage of fish unloaded by commercial fishermen or brought to shore by recreational fishermen for personal use. Landings are reported at the locations at which fish are brought to shore; 2. The part of the catch that is selected and kept during the sorting procedures on board vessels and successively discharged at dockside.

Limited Access Privilege Program (LAPP) or Limited Access Privilege System ${ }^{4}$ - As defined in the Magnuson-Stevens Act, LAPPs limit participation in a fishery to those satisfying certain eligibility criteria or requirements contained in a fishery management plan (FMP) or associated regulation. A limited access privilege is a federal permit, issued as part of a limited access system, to harvest a quantity of fish expressed by a unit or units representing a portion of the total allowable catch (TAC) of the fishery that may be received or held for exclusive use by a person. A LAPP includes an individual fishing quota (IFQ) or individual tradable quota (ITQ) but does not include community development quotas (CDQs). LAPPs are sometimes known as Dedicated Access Privileges (DAPs). However, unlike LAPPs, DAPs generally encompass CDQs as well as IFQs (see "Dedicated Access Privileges"). LAPPs are a type of catch share program. See also "Catch Share Program."

License Limitation Program or Limited Entry Program ${ }^{1}$ - A management tool available to fishery managers where the number of commercial fishermen or vessels licensed to participate in a fishery is legally restricted. A management agency of 10 uses this management tool to limit entry into a fishery.

Limited Entry Program - Also known as a license limitation program; see "License Limitation Program."

Location Quotient - Location Quotients (LQs) are ratios that allow an area's distribution of employment by industry to be compared to a reference or base area's distribution. The reference area is usually the U.S., but it can also be a state or a metropolitan area. The reference or base industry is usually the all-industry total. The following discussion assumes the defaults are used. LQs also allow areas to be easily compared with each other. If an LQ is equal to 1 , then the industry has the same share of its area employment as it does in the reference area. An LQ greater than 1 indicates an industry with a greater share of the local area employment than in the reference area.

For example (assuming the U.S. as the reference area), Las Vegas will have an LQ greater than 1 in the Leisure and Hospitality industry, because this industry makes up a larger share of the Las Vegas employment total than it does for the country as a whole. LQs are calculated by first dividing local industry employment by the all-industry total of local employment. Next, reference area industry employment is divided by the all-industry total for the reference area. Finally, the local ratio is divided by the reference area ratio.

## Magnuson-Stevens Fishery Conservation and Management Act or Magnuson-Stevens Act (MSA) ${ }^{1}$

 Federal legislation responsible for establishing the Regional Fishery Management Councils (FMCs) and the mandatory and discretionary guidelines for federal fishery management plans (FMPs). This legislation was originally enacted in 1976 as the Fishery Management and Conservation Act. Its name was changed to the Magnuson Fishery Conservation and Management Act in 1980, and in 1996 it was renamed the Magnuson-Stevens Fishery Conservation and Management Act.Market-based Management ${ }^{4}$ - Market-based management is an umbrella term that encompasses approaches that provide economic incentives to protect fisheries from overharvest. These approaches contrast with conventional fisheries management approaches, such as buyback programs and license limitation programs (see "Buyback Program" and "License Limitation Program"). One example of a market-based management approach for fisheries is a limited access privilege program (LAPP; see "Limited Access Privilege Program") that includes an individual fishing quota. A LAPP provides individual fishermen an exclusive, market-based share of a harvest quota or total allowable catch (TAC) of a fishery.

Marine Coastal County - For this report, a marine coastal county is a coastal county that is adjacent to an ocean coastline. See also "Coastal County."

Marine Economy - For this report, the marine economy refers to the economic activity generated by fish-ing- and marine-related industries located in a coastal state. Fishing- and marine-related industries were chosen from industries defined in the County Business Patterns Data Series provided by the U.S. Census Bureau. Industries listed in this report were chosen based on that industry's direct contribution to fishing and marine activities, and whether data was available for that industry. Information such as the number of establishments, number of employees, and annual payroll for these fishing and marine-related industries was used to determine their relative levels of economic activity in a state. These industries were categories into one of two industry sectors: 1) seafood sales and processing; and 2) transport, support and marine operations. See also "Industry Sector."

Non-Coastal County Angler - For this report, a non-coastal county angler refers to a recreational fisherman who lives within a given state but not in a coastal county of that state.

Nonemployer Firms ${ }^{3}$ - A nonemployer business is one that has no paid employees, has annual business receipts of $\$ 1,000$ or more ( $\$ 1$ or more in the construction industries), and is subject to federal income taxes. Most nonemployers are self-employed individuals operating very small unincorporated businesses that may or may not be the owner's principal source of income.

Non-Resident - For this report, a non-resident in the U.S. table refers to a recreational fisherman (angler) who resides outside the U.S.; a non-resident in the regional and state tables refers to an angler who did not reside in the state where they fished.

Out-of-state Angler - For this report, an out-of-state angler is a recreational fisherman (angler) who does not reside within a given coastal state.

Overcapacity ${ }^{15}$ - When the harvesting capability within a given fishery exceeds the level of harvest allowed for that fishery.

Overcapitalization ${ }^{10}$ - When the amount of harvesting capacity in a fishery exceeds the amount needed to harvest the desired amount of fish at least cost.

Overfished ${ }^{1}$ - 1. An overfished stock or stock complex "whose size is sufficiently small that a change in management practices is required to achieve an appropriate level and rate of rebuilding." A stock or stock complex is considered overfished when its population size falls below the minimum stock size threshold (MSST). A rebuilding plan is required for stocks that are deemed overfished; 2. A stock is considered overfished when exploited beyond an explicit limit past which its abundance is considered "too low" to ensure safe reproduction. In many fisheries, the term is used when biomass has been estimated to be below a biological reference point that is used as the signpost defining an "overfished condition."

Overfishing ${ }^{1}-1$. According to the National Standard Guidelines, "overfishing occurs whenever a stock or stock complex is subjected to a rate or level of fishing mortality that jeopardizes the capacity of a stock or stock complex to produce maximum sustainable yield (MSY) on a continuing basis." Overfishing is occurring if the maximum fishing mortality threshold (MFMT) is exceeded for 1 year or more; 2. In general, the action of exerting fishing pressure (fishing intensity) beyond the agreed optimum level. A reduction of fishing pressure would, in the medium term, lead to an increase in the total catch.

Protected Species ${ }^{14}$ - Refers to any species that is protected by either the Endangered Species Act (ESA) or the Marine Mammal Protection Act (MMPA), and that is under the jurisdiction of NOAA Fisheries. This total includes all threatened, endangered and candidate species, as well as all cetaceans and pinnipeds, excluding walruses.

Regional Fishery Management Council or Fishery Management Council (FMC) ${ }^{4}$ - The Magnu-son-Stevens Act established eight Regional FMCs around the United States. Each council consists of voting and non-voting members who represent various federal, state and tribal government; fishing industry groups (commercial and/or recreational); and non-fishing groups (such as environmental organizations and academic institutions). Each council is tasked with creating fishery management plans for important fisheries within their regions.

Release - For this report, release refers to the number of individual fish caught by a recreational fisherman (angler) that are then returned to the sea (dead or alive). In Hawai'i and the Atlantic and Gulf states, release does not include fish returned to the sea that are dead. See also "Catch" and "Harvest."

Resident - For this report, a resident in the U.S. table refers to a recreational fisherman (angler) who resides inside the U.S.; a resident in the regional and state tables refers to an angler who resides in the state where they fished.

Sector Allocation Program ${ }^{16}$ - A fisheries management tool where a group of fishermen are allocated a quota or share of a total allowable catch (TAC), in accordance with an approved plan. This program is considered a type of catch share program. See also "Catch Share Program."

Species ${ }^{1}$ - A group of animals or plants having common characteristics that are able to breed together to produce fertile (capable of reproducing) offspring and maintain their "separateness" from other groups.

Species Group ${ }^{1}$ - Group of species considered together of 10 because they are difficult to differentiate without detailed examination (very similar species), or because data for the separate species are not available (for example, in fishery statistics or commercial categories).

Threatened Species ${ }^{12}$ - As defined by the Endangered Species Act (ESA), a threatened species is any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range. See also "Endangered Species."

Trip Expenditures - For this report, trip expenditures refer to expenses incurred by recreational fishermen (anglers) on a fishing trip. Trip expenditures are described for residents (individuals who reside in a coastal or non-coastal county within a given state; a U.S. resident) and non-residents (individuals who do not reside within the U.S.).

Value-Added ${ }^{1}$ - A firm's sales minus the cost of the goods and services it purchases from other industries to produce its outputs.

## GLOSSARY NOTES

Economic impacts from recreational fishing activities were generated using the NMFS Recreational Economic Impact Model (see The Economic Contribution of Marine Angler Expenditures in the United States, 2011, available at http://www.st.nmfs.noaa.gov/economics/publications/marine-angler-expenditures/marine-angler-2011).

[^70]:    ${ }^{4}$ Marine Economy information was not available for East Florida; information for the entire state of Florida is provided here.
    ${ }^{5}$ Unless otherwise stated, data is from the U.S. Census Bureau, http://censtats.census.gov/ (accessed May 31, 2016).
    ${ }^{6}$ U.S. Bureau of Economic Analysis, "Table 1.1.5 Gross Domestic Product" and "Table SA6N Compensation of Employees by NAICS Industry,"
    http://www.bea.gov/iTable/index nipa.cfm (accessed May 31, 2016).
    7 U.S. Bureau of Labor Statistics, "Location Quotient Calculator," http://data.bls.gov/location_quotient/ (accessed May 31, 2016).

[^71]:    ${ }^{1}$ NA = data are not available because out-of-state resident information is collected for individual states but does not specifiy whether an angler resides in a region.
    ${ }^{2}$ Sharks include species within the requiem shark family, blacktip sharks, Atlantic sharpnose sharks and unidentified sharks.

[^72]:    ${ }^{1}$ Economic impacts reported in this table are for the entire state of Florida, not East Florida alone.

[^73]:    ${ }^{1}$ NA $=$ Data is not available because all East Florida residents are considered coastal county residents.
    ${ }^{2}$ In this table, ${ }^{\prime}<1^{\prime}=0-999$ ish and ' 1 ' $=1,000-1,499$ fish.

[^74]:    ${ }_{2}^{1}$ All data presented on this page are for the entire state of Florida, not just East Florida
    ${ }^{2}$ The U.S. Commercial Fishing Location Quotient (CFLQ) is 1 . A CFLQ greater than 1 indicates that more commercial fishing occurs in this state
    than the national average. A CFLQ less than 1 indicates that les commercial fishing occurs in this state than the national average.
    ${ }^{3}$ ds = these data are suppressed.
    ${ }^{4} \mathrm{NA}=$ not applicable.
    ${ }^{5}$ Census Bureau data for the Marine Economy section of this report is available only through 2014.

[^75]:    ${ }^{1} \mathrm{NA}=$ these data are confidential and therefore not disclosable.

[^76]:    ${ }^{1}$ In this table, ${ }^{\prime}<1^{\prime}=0-999$ fish and ${ }^{\prime} 1$ ' $=1,000-1,499$ fish.
    ${ }^{2}$ Sharks include species within the requiem shark amily, blacktip sharks, Atlantic sharpnose sharks and unidentified sharks.

[^77]:    ${ }^{1}$ Census Bureau data for the Marine Economy section of this report is available only through 2014.
    ${ }^{2}$ The U.S. Commercial Fishing Location Quotient (CFLQ) is 1. A CFLQ greater than 1 indicates that more commercial fishing occurs in this state than the national average. A CFLQ less than 1 indicates that les commercial fishing occurs in this state than the national average.
    ${ }_{3} \mathrm{ds}=$ these data are suppressed.
    ${ }^{4} \mathrm{NA}=$ not applicable.

[^78]:    ${ }^{1}$ In this table, ${ }^{\prime}<1$ ' $=0-999$ fish and ' 1 ' $=1,000-1,499$ fish.

[^79]:    ${ }^{1}$ Census Bureau data for the Marine Economy section of this report is available only through 2014.
    ${ }^{2}$ The U.S. Commercial Fishing Location Quotient (CFLQ) is 1 . A CFLQ greater than 1 indicates that more commercial fishing occurs in this state than the national average. A CFLQ less than 1 indicates that les commercial fishing occurs in this state than the national average.
    ${ }_{3}{ }^{\text {ds }}=$ these data are suppressed.
    ${ }^{4} \mathrm{NA}=$ not applicable.

[^80]:    ${ }^{1} \mathrm{NA}=$ these data are confidential and therefore not disclosable.

[^81]:    ${ }^{1}$ In this table, ${ }^{\prime}<1^{\prime}=0-999$ fish and ' 1 ' $=1,000-1,499$ fish.
    ${ }^{2}$ Sharks include species within the requiem shark amily, blacktip sharks, Atlantic sharpnose sharks and unidentified sharks.

[^82]:    ${ }^{1}$ Census Bureau data for the Marine Economy section of this report is available only through 2014.
    ${ }^{2}$ The U.S. Commercial Fishing Location Quotient (CFLQ) is 1. A CFLQ greater than 1 indicates that more commercial fishing occurs in this state than the national average. A CFLQ less than 1 indicates that les commercial fishing occurs in this state than the national average.
    ${ }_{3} \mathrm{ds}=$ these data are suppressed.
    ${ }^{4} \mathrm{NA}=$ not applicable.

[^83]:    ${ }^{1}$ The NMFS Commercial Fishing Industry Input/Output Model was used to generate the impact estimates (see NMFS Commercial Fishing \& Seafood Industry Input/Output Model, available at www.st.nmfs.noaa.gov/documents/commercial_seafood_impacts_2007-2009.pdf).
    ${ }^{2}$ Separate commercial economic impacts were not available for West Florida. Impacts for the entire state of Florida are reported here.

[^84]:    ${ }^{3}$ Trip expenditure estimates were generated from the 2011 National Marine Recreational Fishing Expenditure Survey. Durable good expenditure impacts were generated from the 2014 National Marine Recreational Fishing Expenditure Survey (see http://www.st.nmfs.noaa.gov/economics/fisheries/recre-ational/Marine-Angler-Durable-Expenditures/2014-durable-expenditures-survey). Economic impacts from recreational fishing activities were generated using the NMFS Recreational Economic Impact Model (see The Economic Contribution of Marine Angler Expenditures in the United States, 2011, available at http://www.st.nmfs.noaa.gov/economics/publications/marine-angler-expenditures/marine-angler-2011).

[^85]:    ${ }^{4}$ Marine Economy information was not available for West Florida, information for the entire state of Florida is provided here.
    5 Unless otherwise stated, data is from the U.S. Census Bureau, http://censtats.census.gov/ (accessed May 31, 2016).
    ${ }^{6}$ U.S. Bureau of Economic Analysis, "Table 1.1.5 Gross Domestic Product" and "Table SA6N Compensation of Employees by NAICS Industry," http://www.bea.gov/iTable/index nipa.cfm (accessed May 31, 2016).

[^86]:    ${ }^{1}$ The Marine Recreational Program (MRIP) does not collect angler participation data for Texas.
    ${ }^{2}$ Includes Louisiana resident participation estimated from historical MRIP data (2006-2013) and a state creel survey (2014-2015).
    ${ }^{3}$ Data are not available because out-of-state resident information is collected for individual states but whether an angler is a resident of a region is not specified.
    ${ }^{4}$ The Marine Recreational Program (MRIP) does not collect effort data for Texas.
    ${ }^{5}$ Data on the number of fish released in Texas are not collected by the Texas Parks and Wildlife Department (TPWD) and therefore not reported in this table.

[^87]:    ${ }^{1}$ Kingfishes include southern kingfish and Gulf kingfish.

[^88]:    ${ }^{1}$ Census Bureau data for the Marine Economy section of this report is available only through 2014.
    ${ }^{2}$ The U.S. Commercial Fishing Location Quotient (CFLQ) is 1 . A CFLQ greater than 1 indicates that more commercial fishing occurs in this state than the national average. A CFLQ less than 1 indicates that les commercial fishing occurs in this state than the national average.
    ${ }_{3} \mathrm{ds}=$ these data are suppressed.
    ${ }^{4} \mathrm{NA}=$ not applicable.

[^89]:    ${ }^{1}$ Economic impacts reported in this table are for the entire state of Florida, not West Florida alone.
    ${ }^{2} \mathrm{NA}=$ These data are confidential and therefore not disclosable.

[^90]:    ${ }^{1}$ Data is not available because all West Florida residents are considered coastal county residents.
    ${ }^{2}$ In this table, '<1' $=0-999$ fish and ' 1 ' $=1,000-1,499$ fish.
    ${ }^{3}$ Mullets encompass species within the mullet genus, including striped mullets.

[^91]:    ${ }^{1}$ All data presented on this page are for the entire state of Florida, not just West Florida.
    ${ }^{2}$ The U.S. Commercial Fishing Location Quotient (CFLQ) is 1. A CFLQ greater than 1 indicates that more commercial fishing occurs in this state than the national average. A CFLQ less than 1 indicates that les commercial fishing occurs in this state than the national average.
    ${ }^{3}$ ds = these data are suppressed.
    ${ }^{4}$ NA $=$ not applicable.
    ${ }^{5}$ Census Bureau data for the Marine Economy section of this report is available only through 2014.

[^92]:    ${ }^{1}$ Louisiana data not available for 2014 and 2015.
    ${ }^{2}$ Effort for 2015 is estimated using data from a state creel survey and does not capture shore-based effort separately from private boat effort.
    ${ }^{3}$ In this table, $\quad<1$ ' $=0-999$ fish and ' 1 ' $=1,000-1,499$ fish.
    ${ }^{4}$ Harvest and release totals for 2015 are estimated using data from a state creel survey.

[^93]:    ${ }^{1}$ Census Bureau data for the Marine Economy section of this report is available only through 2014.
    ${ }^{2}$ The U.S. Commercial Fishing Location Quotient (CFLQ) is 1. A CFLQ greater than 1 indicates that more commercial fishing occurs in this state than the national average. A CFLQ less than 1 indicates that les commercial fishing occurs in this state than the national average.
    ${ }^{3}$ ds $=$ these data are suppressed.
    ${ }^{4}$ NA $=$ not applicable.

[^94]:    ${ }^{1} \mathrm{NA}=$ these data are confidential and therefore not disclosable.

[^95]:    ${ }^{1}$ In this table, ${ }^{\prime}<1^{\prime}=0-999$ fish and ' 1 ' $=1,000-1,499$ fish.
    ${ }^{2}$ Kingfishes include southern kingfish and Gulf kingfish.
    ${ }^{3}$ Sharks include species within the requiem shark family, blacktip sharks, Atlantic sharpnose sharks and unidentified sharks.

[^96]:    ${ }^{1}$ Census Bureau data for the Marine Economy section of this report is available only through 2014.
    ${ }^{2}$ The U.S. Commercial Fishing Location Quotient (CFLQ) is 1. A CFLQ greater than 1 indicates that more commercial fishing occurs in this state than the national average. A CFLQ less than 1 indicates that les commercial fishing occurs in this state than the national average.
    ${ }_{3} \mathrm{ds}=$ these data are suppressed.
    ${ }^{4} \mathrm{NA}=$ not applicable.

[^97]:    ${ }^{1} \mathrm{NA}=$ these data are confidential thus not disclosable.

[^98]:    ${ }^{1}$ The Marine Recreational Information Program (MRIP) does not collect participation (number of anglers) or effort (number of trips) data for Texas. To calculate trip expenditure estimates, effort by fishing mode was estimated based on 2013 data provided by the Texas Parks and Wildlife Department (TPWD). These effort estimates were reviewed by the TPWD. To calculate angler expenditure estimates (durable equipment expenditures), participation estimates were based on the sum of saltwater licenses sold in Texas plus a proportion of combination licenses sold in Texas. A change in the method of reporting landings occurred in 2007 so data from 2007 is not comparable to earlier years.
    ${ }^{2}$ Data collected by the TPWG is reported in this table. The data collected by the TPWD differs from the data collected and reported in the MRIP. Data on the number of fish released are not reported by TPWD. Please see the TPWD for more information: www.tpwd.state.tx.us/fishboat/.

[^99]:    ${ }^{1}$ Census Bureau data for the Marine Economy section of this report is available only through 2014.
    ${ }^{2}$ The U.S. Commercial Fishing Location Quotient (CFLQ) is 1. A CFLQ greater than 1 indicates that more commercial fishing occurs in this state than the national average. A CFLQ less than 1 indicates that les commercial fishing occurs in this state than the national average.
    ${ }_{3} \mathrm{ds}=$ these data are suppressed.
    ${ }^{4} \mathrm{NA}=$ not applicable.
