FOREWORD

This report constitutes an annual review on fishery statistics of the United States as well as a summary of activities of the division of fishery industries. As its name indicates, this division of the bureau is concerned with the activities and welfare of the fishery industries, including the commercial fisheries, the trade in fishery products, and

¹ Appendix II to the Report of the U. S. Commissioner of Fisheries, 1931. Approved for publication, June 8, 1931.

the fish canning and preserving industries. Its functions are the collection and publication of fishery statistics, the conducting of market surveys, the prosecution of research designed to solve the technical problems of the industry, and the dissemination of authoritative and practical information to the fishery industries and the public. Results of technological investigations and marketing studies are published in separate documents as each project is completed. The information obtained from statistical surveys is published in Part 2 of this report, which includes all the detailed statistical information that has become available since the issuance of the previous report,² together with such summarized statements and interpretations of the statistics as are deemed significant and useful. There is included a summary of the catch of fishery products in the United States for the half century from 1880 to 1929. In the preparation of this report numerous members of the division's staff have taken part and their assistance is appreciatively acknowledged.

Part 1. OPERATIONS OF THE DIVISION

COLLECTION OF STATISTICS

The statistical work of the division in 1930, as in former years, included the collection and dissemination of statistics on the catch of fishery products and the gear employed in making the catch and statistics of related fishery industries. In the former group are those statistics that are intended for the use of the fishery biologist, upon which to base conservation measures. They are also valuable for economic purposes. This is especially true of statistics for the landings of fish at principal fishing ports, which are published monthly. In the second group are statistics that are of use mainly for economic or trade purposes. These include statistics of the manufactured fishery products and by-products of the United States, cold-storage holdings of fish and amounts of fish frozen in the United States, marine-animal oil production, and similar statistics.

During 1930 unusual progress was made in the collection of statistics of the catch of fishery products in the United States. This has been occasioned by greater cooperation with State fishery agencies and by the extended use of automobiles by agents, which has enabled them to canvass a larger territory than was formerly the case when travel was performed mainly by train. As a result, catch statistics for 1929 were obtained of the fisheries in our New England, Middle Atlantic, Chesapeake Bay, South Atlantic, Gulf, Pacific Coast, and Great Lakes States. Continuous annual catch statistics are now available for the Great Lake States from 1913, Pacific Coast States from 1922, South Atlantic and Gulf States from 1927, New England States from 1928, Middle Atlantic and Chesapeake Bay States starting with 1929 (as it is now planned to canvass the latter States annually), and the State of Connecticut from 1924. Catch statistics are now available on each geographical section for 1929 except for the Mississippi River area and its tributaries. The latest complete statistics for this section are for 1922. However, annual canvasses are made here for the catch of fresh-water mussels, and also for the

² Fishery Industries of the United States, 1929. By R. H. Fiedler, Appendix XIV to the Report of the U. S. Commissioner of Fisheries for 1930, pp. 705-1068. Bureau of Fisheries Document No. 1095.

catch of fish in Lakes Pepin and Keokuk, and that part of the Mississippi River between these two lakes.

In addition to the general catch statistics, the collection and (or) publication of statistics on special subjects was continued during 1930, as follows: The landings of fish by American fishing vessels at the ports of Boston and Gloucester, Mass., Portland, Me., and Seattle, Wash.; landings of halibut at North Pacific coast ports (published monthly, and annual bulletins summarizing these landings for the year); catch of mackerel in the North Atlantic fishery; cold-storage holdings of frozen and cured fish and amount of fish frozen, which are furnished by the Bureau of Agricultural Economics (published monthly); production, consumption, and holdings of marine-animal oils of the United States and Alaska (published quarterly by the Bureau of the Census); production of manufactured fishery products and by-products of the United States and Alaska during 1930; the catch of shad in the Potomac and Hudson Rivers and the catch of alewives in the Potomac River during 1930; transactions on the sponge exchange at Tarpon Springs, Fla., during 1930; volume of fishery products handled at the municipal fish wharf and market, Washington, D. C., during 1930; and the volume of United States imports and exports of fishery products during 1930, furnished by the Bureau of Foreign and Domestic Commerce.

CATCH ANALYSIS—COLUMBIA RIVER CHINOOK SALMON FISHERY

The analysis of the Chinook salmon catch records of individual fishermen on the Columbia River, which is being conducted to determine the catch per constant unit of effort and gear during the years from 1909 to 1930, inclusive, was carried on as outlined in last year's report of the Division of Fishery Industries, "Fishery Industries of the United States, 1929" by R. H. Fiedler, Appendix XIV to the Report of the United States Commissioner of Fisheries for 1930, pp. 705-1068, Bureau of Fisheries Document No. 1095. The purpose of this investigation is to determine a satisfactory index of relative abundance and fluctuations in number of the population of Chinook salmon spawning in the Columbia River.

During the summer of 1930 data were collected consisting of additional records of catches made in the lower river near Astoria from 1909 to 1930, inclusive; records of fish wheel catches from the territory near Warrendale; and information regarding types of gear and boats that have been used in this fishery during the period of time covered by this analysis. The catch records secured from the lower portion of the river indicate that the previous data collected at Astoria constitute an adequate sample of the daily boat catches of that region. From these combined groups of records a reliable index of abundance should be obtained, which will indicate fluctuations in numbers of the total spawning population of each year and of the biologically distinct portions or "runs" of the various years.

The records of the daily catches of the fish wheels at Warrendale, represent a very valuable addition to our records. They provide an index of abundance of the salmon at the point farthest up the river where commercial fishing of any great importance is carried on. It is possible that upon analysis they may yield a reliable record of relative escapement of salmon from the gear in the lower river.

The information secured concerning the types of gear used (the entire analysis has been confined to the records of gill net fishermen and the fish wheel records mentioned above) indicates that during the first six or eight years covered by our data, 1909 to about 1916, there was a steady improvement in the efficiency of the nets. Also it was during the same period that the sail boats became obsolete and boats powered with gasoline engines came into practically universal use in this fishery.

These two factors undoubtedly increased the catch per unit of effort and gear during that time when the change was taking place and must be seriously considered in interpreting the final curves of relative abundance.

The additional data collected during 1930 confirms the conclusions drawn from the previously gathered records: That from 1909 to 1925, the trend of catch per unit of effort and gear was approximately constant and that from 1925 to 1930 it has dropped at an alarming rate.

TECHNOLOGICAL INVESTIGATIONS

Fisheries technology covers a very wide field of activity, in that it deals with an important food industry and sources of valued products in the arts and industries. The study of the technology of many food industries is an extensive subject and few, if any, food industries are as highly diversified as the fishery industries. Fisheries technology is at present demanding the attention and best efforts of chemists, engineers, and bacteriologists. Until a few years ago little had been accomplished in this field of food technology. Much remains yet to be accomplished. The Bureau of Fisheries, the College of Fisheries of the University of Washington, Seattle, Wash., and some of the larger fishery companies have been the leaders in this field. Developments have come very rapidly in recent years. The technical handling, preservation, and distribution of foods through the medium of refrigeration, particularly to inland consumers, has been largely a result of research activities in fisheries technology. Great progress has been made in the elimination of waste in the fishery industries. The enormous strides in the manufacture and uses of marine by-products are a real contribution to the science of animal nutrition. In fact, progress in some branches of fisheries technology, described in detail in the following pages, has been so great that other food industries are looking to this industry for guidance.

BY-PRODUCTS AND PRODUCTION METHODS

THE MENHADEN INDUSTRY

For years fish scrap and fish oil have been established by-products of the fishing industry. Until recently, however, they were looked upon as low-grade materials. Fish scrap was manufactured and sold for use in fertilizer compounds and fish oil was marketed solely as a cheap substitute for other oils used by several technical industries. Within the past few years, largely through the efforts of the Bureau of Fisheries and certain enterprising individuals associated with the fish scrap and fish oil industry these products have become recognized as possessing greater potential usefulness. Investigation has shown

that properly prepared ground-fish meal is a valuable animal feedstuff and carefully rendered oils have increased value for technical use and that certain of them possess sufficient vitamin A and D potency to warrant their use in animal feeding.

Fishery by-products of the type manufactured in the past are decreasing in usefulness as competitive industries have progressed. Fishery by-products of improved quality have at least kept pace

FIGURE 1.—Laboratory press used in connection with studies in menhaden industry

with competitive products and in some cases have gained increased prestige and even greater value.

During the past year the bureau's technologists completed an extended study of the menhaden industry, a summary of the findings follows:

(1) The bilge water from a menhaden steamer generally contains sufficient oil to warrant recovery at the factory.

(2) Most efficient operation from a continuous screw press may be expected when (a) the liquors are not required to traverse a great thickness of press cake, (b) the pressure is increased slowly, and (c)

sufficient time is given to permit the liquors from the center of the cake to reach the outer surfaces.

(3) The continuous screw press extracts a greater portion of oil and water from cooked menhaden than any of several types of centrifugal equipment tested.

(4) Menhaden press liquors contain approximately 22 per cent of the total solids of the original material. Of this amount about 17 per cent is dissolved materials and about 5 per cent is suspended material.

(5) Under present operating conditions all dissolved materials are discarded and only about one-third of the suspended materials are recovered.

(6) In the separation of the oil from the press liquors only about 90 per cent of the oil is recovered as first-grade oil, about 2 per cent is lost, and the remaining 8 per cent is recovered in such a manner that it has lost approximately half its value.

(7) By treating press liquors with a chemical coagulant, such as aluminum sulphate, and passing the liquors through a pressure filter the oil and water emulsion is broken, and all suspended solids and about one-third of the dissolved solids may be recovered. In addition, such treatment may be expected to give a greater oil recovery.

(8) Approximately 80 per cent of the suspended material may be recovered without difficulty by means of a 60-mesh mechanical screen.

(9) Screened press liquors may be handled successfully in a mechanical separator. A similar separator will also recover the oil from the present waste waters.

(10) Low acid oil may be obtained from fresh gurry by mechanical separators as well as by filter pressing with a filter aid.

(11) Estimated recovery costs based on the solids content of press liquors and data supplied by manufacturers of evaporators indicate that the possibility of recovering the solids in waste waters warrants the consideration of manufacturers of evaporators and menhaden operators.

(12) Storing oil in open tanks at the factory causes an increase in the free fatty acid content of the oil.

(13) The present flame drier used in the industry causes a loss of over 10 per cent of the monetary value of the scrap dried.

(14) Steam-tube driers will reduce the present loss in monetary value of dried scrap by over 50 per cent.

(15) Hot dried scrap may be cooled rapidly in an aerator and a portion of the residual heat used for further drying of the material.

(16) Preliminary feeding tests indicate that steam-dried menhaden meal has greater nutritional value than the flame-dried product.

(17) The quantity of fat extractable with ether decreases during storage. The rate of the decrease is more rapid in the flame-dried product.

(18) Menhaden stored at temperatures of from 35° to 40° F. are apparently in as good a condition for reduction purposes after 5 to 6 days as fish kept at ordinary summer temperatures for a period of 24 hours.

MANUFACTURING FISH OILS OF HIGHER VITAMIN POTENCY

The interest which has been aroused concerning the use of fish oils in animal feeding suggests that if these oils are suitable for such usage more should be known about the relation which method of manufacture bears to nutritional value. Data should be available to guide the fish oil producer in manufacturing an oil conserving as near as possible, its original vitamin potency. With this in mind, an investigation was undertaken to measure the effect of the various operations in the manufacturing process on the vitamin potency of the oil.

The data obtained as a result of the test work disclosed that the greatest destructive effect on vitamin D during the reduction process can be attributed to the present method of breaking the separated oil emulsion by treatment with heat in the oil cooking tanks. Fish oil manufacturers who desire to produce oil of higher vitamin potency therefore should take steps to eliminate the operation from the factory process. Information obtained during the test work suggested also several methods of manufacturing procedure whereby this could be accomplished.

The first method requires the use of (a) a mechanical screen to remove the majority of the suspended solids in the press liquors, (b) a centrifuge which gives a three-phase separation to make a preliminary separation of the oil portion in the presence of fine solids, and (c) a centrifugal oil purifier.

A second method would require the use of (a) a centrifugal extractor to remove the solids present in the press liquors, (b) a screening arrangement to recover the solids removed by the extractor, and (c) a centrifugal oil and water separator to make the final oil and water separation.

A third method would require (a) immediate filtration of chemically treated press liquors, (b) mechanical separation of the filtered liquor, and (c) mechanical purification of the separated oil.

A fourth method would require (a) the use of a screen to remove the bulk of the suspended material as the liquor flowed from the press floor, (b) the use of the present system of gravity separating tanks, and (c) a centrifugal separator to remove the oil from the separated emulsion.

A fifth method would permit the use of the present factory process up to the point where the oil and emulsion is floated to the cooking tanks. The separated oil layer then would be filter pressed to remove fine solids held in emulsion and the oil recovered in a centrifugal oil separator.

All of the above procedures are applicable to the present wet reduction process as the liquors flow from the press floor. In the case of menhaden oil, application of the above principles was found to yield an oil having a vitamin D potency 25 per cent higher than oil manufactured by the present process.

COOKING AND PRESSING FISH

Realizing the importance of the cooking and pressing operations in the manufacture of fish oil and fish meal from such fish as menhaden, sardine, and herring, and the waste resulting from salmon, tuna, and mackerel canning operations, bureau technologists, during the past year, undertook a study of certain aspects of the cooking and pressing

of oily fish. The primary objects of the study were to obtain (1) data concerning the possibility of reducing pressing losses as a result of cooking methods, (2) data which could be used to guide press operation, and (3) data which could be used as a basis for press design. In order to determine this, tests were made on (a) the effect of the amount of cooking on extraction, (b) the effect of cooking fish by direct and indirect steam heat on oil extraction, solids lost in press liquors, color of oil and acidity of the oil, (c) the effect of the intensity of pressure on extraction and solids loss, (d) the effect of the rate of pressure increase on extraction and solids loss, (e) the effect of time on extraction, (f) the effect of aperture size on extraction and solids loss, (g) the effect of the thickness of press cake on extraction, and (h) the effect of preliminary drainage on extraction. Although the experimental work has been concluded the data have not been sufficiently analyzed to permit definite conclusions to be published at the present writing.

REDUCTION OF NONOILY FISH WASTE

Knowledge obtained in past researches by the bureau on the effect of methods of manufacture on the nutritive value of fishery by-products has given impetus to the bureau's study of efficient utilization of the waste incident to the North Atlantic ground fishery and the waste accumulated in the preparation of these fish for market as packaged products. During the past year a program has been worked out which will involve an exhaustive and detailed study of this subject. The investigative work outlined has been designed to determine the relation of: (1) Temperature, (2) method of applying heat, (3) kind of heating medium, (4) length of contact with the heating medium, and (5) particle size upon the quality of the products and the efficiency of the process. Both chemical and biochemical studies will be carried on in connection with the engineering studies, and products for both human and animal consumption will be investigated. The investigation will also include a continuation of the bureau's study of the utilization of trawler waste.

In past studies on this subject, efforts have been made to adapt equipment designed for other purposes to fit the requirements for fish meal and fish flour manufacture. Although the studies indicated certain improvements the final results were never completely satisfactory. It is believed, therefore, that in determining the relation of certain principles of reduction and the chemistry of the material to the quality of the final product manufactured, more intelligent progress will result. This work is contemplated for the Gloucester technological laboratory of the bureau.

THE IODINE NUMBER OF HADDOCK LIVER OIL

According to the Pharmacopœia of the United States, cod-liver oil is specified as being obtained from the fresh livers of the cod, *Gadus morrhua* Linnæus and of other species of *Gadus*. The latter statement was evidently meant to include fish of species related to the cods, such as haddock, cusk, hake, and pollock. Even though this conception of the definition is generally accepted the specifications on iodine value have raised a question of importance to the ground-fish industry. Some samples of haddock liver oil have shown an iodine value of over 180, which is the maximum prescribed by the Pharmacopœia.

Before the era of packaged fish the above fact did not offer a problem, since the availability of cod livers greatly exceeded that of haddock livers. Since that time, however, some of the largest concerns in the ground fishery have grown primarily on trade in packaged haddock fillets. Thus, within the space of a few years, the domestic supply of livers for liver oil manufacture has turned from cod to haddock.

In view of the fact that the present domestic demand for cod and cod-liver oil is about 5,000,000 gallons annually, while domestic production is less than 300,000 gallons, it is considered important that every effort be made to encourage the use of livers suitable for this purpose. However, before progress can be expected, manufacturers must be assured that the possibility of the high iodine number of haddock liver oil will not detract from the monetary value of the product. Accordingly, during the past year, the bureau made preliminary plans incident to an investigation of this problem which is now under way.

The scope of the investigation will include a study of the iodine number of haddock liver oil at different seasons of the year from fish caught on the various important fishing grounds. This work will then be correlated with a biochemical study of the oils, and if the results indicate that present specifications are detrimental to the future of haddock liver oils, recommendations will be made in an effort to obtain for the product just consideration.

IMPROVED HANDLING OF FRESH AND FROZEN FISH

During the year the bureau established a refrigeration laboratory at the Municipal Fish Market in this city for the purpose of continued studies in the evaporation of moisture from frozen fish, the rusting of frozen fish, and the losses incurred through leaching of fish packed in ice. The equipment consisted of a laboratory brine freezer, which employs dry ice as a cooling medium for the brine. The fish are frozen in aluminum pans and molds floated on the brine. The cooling is accomplished by placing the dry ice in pans arranged with "fins" on the bottom so as to obtain the maximum surface contact and increase the refrigeration efficiency. In actual practice it was found that 1 pound of dry ice would lower the temperature of 4 cubic feet of brine approximately 4° F. The heavily insulated cabinet around the brine tank renders it possible to hold temperatures as low as 60° below zero F. with a comparatively small quantity of dry ice.

In addition to this quick freezer, the laboratory was equipped with three electric refrigerators. These were supplied with an oversize unit capable of holding a temperature of 15° below zero F. A specially constructed thermostat was arranged so that it would hold the temperature constant within 0.2 of a degree F. These refrigerators were also equipped with a recording thermometer, which made a continuous record of the temperatures.

The fish to be studied were first frozen at temperatures of approximately 50° below zero F. These were then coated with hydrogenated cottonseed oil, untreated cottonseed oil, peanut oil, or corn oil; also one sample was water glazed as a control. They were stored at a constant temperature approximating the conditions of commercial storage as nearly as possible. The samples coated with cottonseed oil showed up particularly well, reducing the evaporations from about

23 per cent in the glazed fish control to 6 per cent in the treated fish. It is estimated that this treatment will cost the producer less than 1 cent per 40 pounds of fish, and will not detract in any way from the value. In fact, it enhances the value of the fish, as cottonseed oil is edible and is often used as frying fat.

During the time when this work was being conducted at the request of the authorities of the District government, the technologist offered suggestions which would tend to increase the attractiveness of the Municipal Fish Market. These dealt with the sanitary conditions,

FIGURE 2.—Fish packaging

improvements in refrigeration facilities for the stores, and general recommendations.

LEACHING OF FOOD AND MINERAL VALUES

It has been recognized for several years that there is appreciable loss of food value and mineral constituents when fish are packed in contact with crushed ice. The water from the melting ice drips over the fish and results in a leaching effect.

The losses incurred in weight of the fish in food and mineral value have never been determined, and very little has been done to prevent losses of this nature. In preliminary experiments it was found to be as high as 4 pounds per ton over a period of seven days. This apparently is not a great loss until it is multiplied by the amounts of fish handled in crushed ice over a period of a year; then it begins to assume proportions which are really surprising.

In this same consideration it should be emphasized that the flavor and mineral constituents of the fish are the most important con-

stituents which are most readily lost by leaching, and if losses of this nature are reduced the taste and food value of the fish will be little impaired from that as originally caught.

The first series of these experiments has been completed, including a detailed report of the findings.

FREEZING OYSTERS

During the past year experiments have been conducted on freezing oysters. If rapidly frozen oysters could be introduced for consumption in the summer months and the public induced to buy them, the yearly output of the producers could be increased materially. The research has demonstrated that oysters can be rapidly frozen

FIGURE 3.—Quick freezing fish fillets for packaged trade

and placed in cold storage for several months without impairing the taste.

NET PRESERVATION

Investigation of net preservatives has indicated four general lines for study, as follows: (1) Development of chemical preservatives, (2) application of chemicals to textiles, (3) variability of location of nets, (4) yearly variability of deterioration in one locality. Under the first subheading the work of 1930 indicates that colloidal silver, selected dyes, and certain antioxidants have valuable preservative properties. Thorough milling of solid constituents of a net dip appear to be highly beneficial. The utilization of tung oil or of special lacquers for net preservation seems advisable. Under the second heading ideal practice has been demonstrated as described in Bureau of Fisheries Economic Circular No. 74. The study of the variability of fishing waters in relation to net preservation has been greatly expanded in the past year, material being exposed in 21 fishing areas covering all sections of continental United States in

addition to the accelerated exposure at Beaufort, N. C. No special attention has been given to the yearly variability as this has been previously recognized. It was noted, however, that due to local drought conditions the fouling of nets in Chesapeake Bay was exceptionally heavy in 1930. The deterioration of nets appears to be primarily influenced by currents, depth of water, character of bottom, concentration of bacteria, salinity, and temperature. The work of 1930 was divided between trap netting and gill netting since these are not only important classes of nets in themselves, but are typical of most of the other nets in the matter of preservation.

TRAP NETS

These represent the nets that must be exposed in water for long periods. They must be strong to withstand storms and rough handling, and hence are made of heavy cotton. It is desirable that the webbing should be flexible, resistant to abrasion and marine growths, and yet be as light as possible. During 1930 these ideal conditions were approached by several preservatives. The principle of impregnating the twine with a light chemical mixture and covering this with a heavy mixture appears to have been established as highly beneficial.

Copper oleate, when used in combination with other materials, continues to be very efficacious, especially in fresh water. Coal tar is still an essential component in the most desirable trap preservative formulæ. The fishermen suffer heavy losses due to inferior tars, and a high grade standard quality is greatly needed.

GILL NETS

Exposures of gill-net thread were made in representative waters in 1930 and at the Reedville (Va.) laboratory. Extensive work was carried on in which the small gill nets were operated to reproduce on a laboratory scale the service of commercial gill nets, except that the catch of fish was kept at a minimum. By this means information was gained concerning comparative deterioration of cotton, silk, and linen, the effects of preservation on webbing, and certain effects of chemical washing. The most important fact demonstrated was that the deterioration of a gill net by the direct rays of the sun is much more destructive than water exposure for the same length of time. A certain chemical was proven to be highly efficacious in resisting the destruction caused by the rays of the sun.

Much data on these classes of twine were obtained through the assistance of fishermen and other cooperators, who exposed small mailable samples, which were afterwards returned to Washington for inspection. This principle of obtaining information regarding special fishing waters may be of considerable future value.

NUTRITIVE VALUE OF MARINE PRODUCTS

Marine products represent an important source of food. This class of foods, generally speaking, is a good source of proteins, vitamins, and minerals in quantity and variety. Because of these facts and because the primary consideration of food products is their food value, the Bureau of Fisheries has become greatly interested in the science of nutrition.

As stated in the 1929 report of this division, this bureau arranged with the Bureau of Chemistry and Soils a cooperative research program to study the nutritive value of marine products and assigned a chemist for this purpose to the laboratories of the protein and nutrition division of the Bureau of Chemistry and Soils, United States Department of Agriculture. As previously reported, the first studies dealt with the vitamins A and D content of such commercial fish oils produced in the United States and Alaska as tuna, salmon, pilchard (California sardine), Alaska herring, Maine herring, and menhaden. Some of these oils were found to be good sources of vitamin D for animal feeding. It was thought that heat and oxidation in the process of manufacture now in commercial use might adversely affect the vitamin content of these oils. Accordingly, studies of the effect of different processes of manufacture of experimentally prepared oils were inaugurated. Some of these have been completed. A study of the above character made in connection with menhaden fish oils revealed that, whereas commercial menhaden oil contained only about three-fourths the vitamin D content of medicinal cod-liver oil, menhaden oils prepared according to some of the experimental processes described in the by-products section of this report were equally as potent in vitamin D as medicinal cod-liver oil.

Salmon oils extracted from the canned offal of the five commercial species of salmon were tested. Four out of the five tested species proved to be equal to medicinal cod-liver oil in content of vitamin A. All of these oils were equal to medicinal cod-liver oil in vitamin D, and three of the species were twice as potent in vitamin D as medicinal cod-liver oil. Oils extracted from the edible canned product of the five species of salmon proved to be equal in vitamin D content to medicinal cod-liver oil; however, the vitamin A content was relatively low. This may be due to the canning process or present cannery methods. Other experiments being conducted by our biochemists in the laboratories of the Bureau of Chemistry and Soils are (a) the vitamins A and D content of burbot liver oil, (b) the chemical and physical characteristics of burbot liver oil, (c) the vitamin D content of oysters from different localities of the United States.

In view of the fact that American fish oils are comparatively rich in vitamins A and D, these may replace imported cod-liver oil in this country and lessen our dependence on foreign sources of supply. Experiments indicating the relatively high vitamin content of canned salmon should be of considerable interest to our great salmon-canning industry.

The bureau's investigator at Johns Hopkins University has completed certain experimental work in connection with the mineral content of fish meals and kelp meal. Spectrographic analyses of the mineral elements occurring in these products were made. In some instances some of the less common elements were identified in quantities too small to be detected by ordinary chemical analyses. As far as possible, however, chemical analyses were conducted to verify the spectrographic determinations. The following mineral constituents were found, either by chemical or spectrographic analyses: Aluminum, barium, boron, calcium, chromium, copper, fluorine, iron, iodine, lead, lithium, magnesium, manganese, nickel, niobium, phosphorus, potassium, sulphur, silicon, silver, sodium, strontium, thallium, tin, titanium, vanadium, and zinc.

FISH-FARMING INDUSTRIES OF THE UNITED STATES

Continuing the work started in 1928 in a survey of the goldfish industry, the fish-farming industry was further studied during 1930 when a market survey was made of the trout and pond-fish industries. The fish farmed in the trout industry are brook trout, brown trout, rainbow trout, cut-throat trout, lake trout, and landlocked salmon. In the pond-fish industry, largemouth and smallmouth black bass, crappie, blue-gill sunfish, and catfish are farmed.

As a result of the survey it was found that the commercial raising of trout extends throughout the United States, although it is chiefly centered in the northern regions and those of high altitude, with the most important centers of the industry being located in Colorado, and in the North Atlantic States. The pond-fish industry, with but few exceptions, is confined to the more southern parts of the United States, where warmer waters, which are necessary for the growth of pond-fish are found.

In 1929 there were 133 trout and 11 pond-fish establishments raising fish commercially in the United States. These employed 262 persons, who were paid \$277,538 in salaries and wages. Those raising trout used 5,969 acres of water, and those raising pond fishes used 638 acres. The products marketed in the trout industry were valued at \$1,072,700, and consisted of eggs, fry, fingerlings, yearlings, and adults. The products of the pond-fish industry were valued at \$21,444, and consisted of fingerlings, yearlings, and adults. The value of these products combined with \$942,000, the value of the products marketed annually by the goldfish industry, makes the annual production of all fish-farming industries in the United States worth \$2,036,144.

Trout and pond-fish products are distributed mainly during the summer months, and almost wholly by the individual producers. The greater proportion of the production is sold directly to consumers at the hatchery, or shipped to them on orders received at the hatchery. Eggs, fry, and fingerlings are purchased for stocking mainly by sportsmen's organizations, and State and Federal Governments, although some are purchased by individuals for stocking private streams or lakes. Yearlings and adults are also bought by the above types of purchasers for stocking purposes, although the greater proportion is purchased by hotels, restaurants, dining cars, other commercial eating houses, and individuals for eating purposes.

The full report on this survey is contained in Fishery Circular No. 2 entitled, "Fish-Farming Industries of the United States." This may be purchased for 5¢ from the Superintendent of Documents, Government Printing Office, Washington, D. C.

FISH OILS

During the year 1930 the price of all fats and oils decreased markedly—marine-animal oils being affected more adversely than any others. In addition to the drop in price the demand for domestic oils of marine origin decreased to the point where very little oil could be sold at even the extremely low prices which prevailed. In order to determine the reason for these conditions the bureau conducted a study of the markets for marine-animal oils in the United States. In making the study, the bureau's representative (1) inter-

viewed members of the more important consuming industries (manufacturers of soap, paint, linoleum, oil cloth, and feed), in order to determine the attitude of the trade toward the oils, (2) interviewed concerns interested in the sale and distribution of the oils, and (3) reviewed all available statistics concerning the production, importation, and consumption of the oils during the past decade.

The results of the survey show that both the consuming public and the consuming industries hold a general apathy toward the use of marine-animal oils, especially the fish oils. The consumption of these oils is based upon their serving as cheap substitutes for other fats and oil. This condition has resulted from the manufacture of inferior products in the past, lack of uniformity in the quality of the present domestic product, and improper marketing methods. In addition, the competition received from foreign marine-animal oils and the apparent preference of the consumer for some of these in place of domestic oils has tended to decrease the utility of the domestic oils by the development of a most unhealthy condition in the domestic supply.

The study indicates that if the domestic marine-animal oil industry is to prosper in the future it must break down the apathy toward the use of these oils, and increase their usefulness to the consumer by improving their quality, by finding new outlets, and by reducing the present effect of competitive products.

VIRGIN ISLANDS OF THE UNITED STATES

After the President's return to Washington from his visit to the Virgin Islands of the United States, the economic plight of these islands was brought forcibly to the attention of the various governmental departments and establishments, and, wherever possible, each was requested to give consideration to methods for alleviating this condition.

As no recent data were available in its field, the Bureau of Fisheries made arrangements for a brief economic survey of the fisheries with the intention of securing detailed data on the methods and practices followed, and to suggest possible changes for their improvement.

On May 2, 1931, the writer and one of the division's technologists were detailed to conduct this survey and on May 15, 1931, began work in St. Thomas, Virgin Islands. In the course of the work, about 85 per cent of the fishermen were interviewed in all the principal fishing localities as well as many people interested in the fisheries. The preliminary survey was completed on May 30, 1931.

As a result of the survey it was found that the industry in the islands is faced with the problem of marketing the catch now obtained rather than that of securing a sufficient supply, for there is reason to believe that there are many times throughout the year when the local markets are glutted with fish, making it impossible to dispose of the catch. Two plans appeared feasible for expanding the market. These are: (1) Expanding the market for fresh fish; (2) Establishment of a local fish-curing industry to replace imported cured fish. In order to further these plans, the division's technologist remained to conduct experiments along these lines. If successful, the economic welfare of the fisheries of the islands will be materially benefited.

PUBLICATIONS OF THE DIVISION

During the calendar year 1930 the following publications were prepared and issued by this division. The list does not include the monthly statistical bulletins of the landings of fish at Boston and Gloucester, Mass., Portland, Me., and Seattle, Wash., nor the monthly reports on cold-storage holdings of frozen fish. The documents may be purchased from the Superintendent of Documents, Government Printing Office, Washington, D. C., at the prices shown. The statistical bulletins are distributed free of charge upon request. Persons interested in securing the statistical bulletins as released may have their names placed on the bureau's mailing list upon request.

Part 2. FISHERY STATISTICS

REVIEW

As the scope of fishery statistics has widened with frequent surveys being made, more definite analyses, and trends have been made possible.

GENERAL

The catch of fishery products in the United States and Alaska during 1929 exceeded that during the previous year. The value of the output of canned fishery products and by-products in 1930 decreased as did the production of packaged fish. The production of frozen fish increased over 1929, and both imports and exports of fishery products decreased as compared with 1929.

In 1929, the domestic fisheries employed more than 191,000 persons, of whom about 123,000 were fishermen, 4,000 were employed on transporting craft, and 64,000 were engaged in wholesale and manufacturing industries. The catch amounted to about 3,567,000,000 pounds, valued at \$123,054,000.

In 1930, the production of canned fishery products amounted to 576,685,000 pounds, valued at \$82,858,000, and the output of by-

FIGURE 5.—Production and value of the fisheries of the various sections of the United States and Alaska, 1929

products was valued at \$23,721,000. Cold-storage holdings of fish averaged about 62,400,000 pounds monthly, while 139,297,000 pounds were frozen. The production of fresh, frozen, and smoked packaged fishery products amounted to 80,014,000 pounds, valued at \$12,580,000. Fishery products imported for consumption were valued at \$50,830,000, while domestic exports were valued at \$17,276,000. The production of cured fish in 1929 amounted to more than 119,000,000 pounds, valued at \$18,000,000.

YIELD OF FOOD FISHERY PRODUCTS, BY VOLUME

The yield of food fishery products in the United States and Alaska amounted to 3,098,000,000 pounds in 1929. About 155 products contributed to this poundage. When considered by individual products, it was found that 80 per cent of the entire yield consisted of 11 groups of products. First in importance among these were pilchard, which is utilized in California for canning as sardines. Of second importance was salmon, which is the basis for a valuable canning industry on our Pacific coast from California north to the Bering Sea. Sea herring was third in importance. These fish are used extensively in Maine for canning as sardines, in Alaska and New

England for salting and smoking and large quantities are also frozen for use as bait. Haddock which is taken on the banks off the North Atlantic seaboard, ranked fourth. This fish is the basis for the fresh and frozen packaged fish trade. Oysters ranked fifth in importance. These were taken commercially in nearly every sea-coast State. Those taken in the more northern latitudes generally are marketed fresh, while those taken in the Southern States are used principally for canning. Mackerel was sixth in importance and was taken along the North Atlantic coast and off the coast of California. Cod ranked seventh and was taken mainly in the vessel fisheries prosecuted from the New England ports. Cod is used largely for salting. Shrimp, which was eighth in importance, is used chiefly in the canning industry in the Southern States. Crabs were ninth in importance and

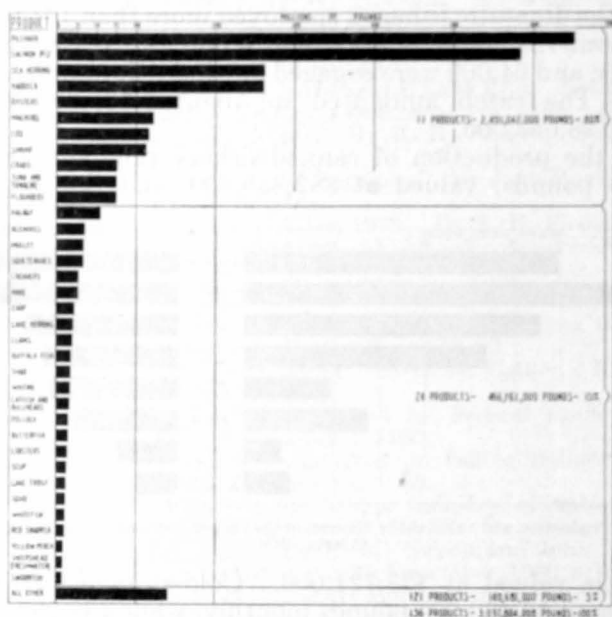

FIGURE 6.—Yield of edible fishery products taken in the United States and Alaska, 1929

were taken chiefly in the Chesapeake Bay region, where they constituted one of the most important fisheries. Tuna and tunalike fishes, which are taken off the coasts of California and Latin America, were tenth in importance and form the basis for an important canning industry in California. Flounders, which ranked eleventh in importance, were taken in the marine fisheries of all sections.

Among the species of moderate commercial importance were 24 products whose yield contributed 15 per cent to the catch in 1929. Included in this group are some whose catch in previous years greatly exceeded the present yield—shad and lobsters being outstanding examples.

The species of least importance consisted of approximately 120 products whose yield accounted for only 5 per cent of the total catch. This group includes certain species which were at one time of considerable importance, but usually they constitute products of limited supply or inferior quality.

YIELD OF FOOD FISHERY PRODUCTS, BY VALUE

When considered according to value, 18 products accounted for 80 per cent of the catch in 1929. Listed in order of their importance they were: Salmon, oysters, haddock, halibut, shrimp, tuna and tunalike fishes, clams, lobsters, pilchard, cod, flounders, mackerel, shad, crabs, sea herring, squeteagues, lake trout, and whitefish.

It will be noted that the rank of species when considered according to value differs considerably from that shown with respect to volume. While pilchard ranked first in volume, its place in value was ninth, and salmon, which was second in volume, ranked first in value. Considerable variation of this type is noticeable due to the difference in unit values.

In the group of moderate importance, 26 products accounted for 15 per cent of the total value and in the group of least importance, about 110 products accounted for the remaining 5 per cent of the value.

FIGURE 7.—Value of edible fishery products taken in the United States and Alaska, 1929

YIELD OF NONFOOD FISHERY PRODUCTS

The yield of nonfood fishery products in the United States and Alaska in 1929 amounted to 469,000,000 pounds, valued at \$5,303,000. The most important products in this group were menhaden and fresh-water mussel shells. The menhaden is manufactured into scrap and meal for use as fertilizer or in animal feeding and into oil which is used extensively in the making of soap and paint. Fresh-water mussel shells are utilized chiefly in the manufacture of pearl buttons and novelties. Other important products in the nonfood group were whale products, king crabs, and sponges.

YIELD OF THE MARINE FISHERIES OF THE UNITED STATES, BY GEAR

With respect to the weight of the catch in the marine fisheries of the United States, 7 types of gear accounted for 88 per cent of the total. In order of their importance they were: Purse seines, which accounted for 28 per cent of the catch; lampara nets, 18 per cent; otter trawls, 15 per cent; lines, 13 per cent; pound nets, 6 per cent; and dredges and gill nets, each, 4 per cent.

Considered according to the value of the catch, 10 types of gear accounted for 91 per cent of the total. In order of their importance they were: Lines, which accounted for 17 per cent of the value; otter trawls, 16 per cent; dredges, 15 per cent; purse seines and pound nets, each, 9 per cent; gill nets and tongs, each, 7 per cent; pots and lampara nets, each, 4 per cent; and haul seines 3, per cent.

YIELD OF THE FISHERIES OF THE UNITED STATES, 1880 TO 1929

Only one complete survey for statistics of the commercial catch of fishery products in the United States has been made during the 50 years from 1880 to 1929, that being in 1908. However, during this period from 5 to 24 annual surveys have been made in the individual geographical sections. It is apparent, therefore, that data are not available to compute an actual trend of the fisheries during the past half century. It is possible, however, to compute average annual yields from the figures obtained in those surveys which have been made by prorating the yields for the intervening years. The table presented on page 143 is the result of such computations.

FIGURE 8.—Yield of the fisheries of the United States, 1880 to 1929

From this tabulation it will be noted that the yield of the commercial fisheries of the United States (excluding Alaska) has increased from 1,614,789,000 pounds in 1880 to 2,915,854,000 pounds in 1929, an increase of about 80 per cent. In general the increase has been consistently upward, showing the largest catch in 1929.

Considered according to geographical sections the fisheries of the New England States have shown comparatively little fluctuation, although in the past few years there has been an upward trend. In the Middle Atlantic States the trend has been downward, the catch 1880 never having been equalled in subsequent years. The catch in the Chesapeake Bay States in 1929 closely approximates that of 1880, however, during the intervening years, the yield has usually exceeded that of either the early or late years of the period. The peak was reached in 1920. The catches in both the South Atlantic and Gulf States have increased consistently from 1880 to 1929, the catches in 1880 being the smallest and those in 1929 by far the largest. In the Pacific Coast States the catch in 1929 exceeds by far that of any year during the period under review. There were numerous fluctuations in the trend until the past few years when there have been consistent increases. The yield of the fisheries of the Mississippi River and tributaries reached its peak in 1908. Since then the trend has been downward, but it yet is more than double that of 1880. In the lake fisheries the yield increased rather consistently from 1880 to 1890, when the largest catch was made. The period since 1890 has been marked by many fluctuations in the catch, finally reaching the lowest level on record in 1928. A partial recovery was experienced in 1929.

NEW ENGLAND STATES

The most recent general statistics of these States, which are for 1929, show that both the catch and value of the catch exceeded that in any year for which there are records. The catch increased 15 per cent in quantity and 13 per cent in value as compared with the catch in the previous year. Larger catches of haddock and mackerel were mainly responsible for this increase. Landings of fish at Boston, Gloucester, and Portland were the largest on record, although the value of these fish was somewhat less than in the previous year.

The output of packaged fish registered a decline of 7 per cent as compared with that in the previous year. The frozen fish trade shows a considerable increase in 1930 over 1929. The production of sardines, which is the principal fish-canning industry in this section and is centered in Maine, showed a decrease as compared with the previous year. The cured-fish industry increased in volume over that in 1928.

MIDDLE ATLANTIC STATES

The value of the catch of the fisheries of the Middle Atlantic States in 1929 exceeded that in any year for which there are records. This increased value is due largely to increased activities in the oyster industry. The weight of the catch was also greater than in 1926, when the most recent previous general survey was made.

Landings of fish at New York City and Groton, Conn., which consisted largely of haddock, flounders, cod, mackerel, and tilefish,

decreased perceptibly as compared with 1929. The packaged-fish trade also decreased, as did the trade in frozen fish. The production of menhaden decreased as compared with that in 1929. The catch of shad in the Hudson River increased somewhat over the previous year. The production of cured fish showed a marked increase over 1926, the most recent previous year for which this industry was surveyed.

CHESAPEAKE BAY STATES

The most recent general statistical canvass of this section, which was for 1929, shows the smallest catch of fishery products since the survey for 1888. The decline in the volume of the menhaden catch has been largely responsible for this decrease in the total catch. The catch of shad in the Potomac River during 1930 was much less than that of 1929, but the catch of alewives increased slightly. The production of packaged fish was about the same as in 1929. The production of cured fish in 1929 was less than in 1925, when the previous survey for complete statistics of these products was made. The value of the production of menhaden products in 1930 was approximately the same as that in 1929.

SOUTH ATLANTIC AND GULF STATES

Statistics of the fisheries of these States for 1929 show the largest catch on record, although the value of the catch was exceeded in both 1927 and 1928. The production of cured fishery products in 1929 almost equalled the output in the previous year.

There were decreases in the production of canned oysters and shrimp as well as menhaden products. The manufacture of each of these products is an important industry in this section.

PACIFIC COAST STATES

In the years for which records are available the catch of fishery products in this section has increased constantly. In 1929 there was an increase of 47 per cent in the catch and 22 per cent in the value of the catch as compared with the previous year. The production of frozen fish was greater in 1930 than in 1929. The pack of cured fish decreased in 1929 as compared with the previous year. There was a decrease of 35 per cent in the pack of salmon in 1930 as compared with 1929, due to the smaller pack of humpback or pink salmon, as 1930 was the "off year" for these species. Compared with the pack in 1928, the previous "off year," there was an increase of 25 per cent in the pack. There was a decrease in the pack of sardines in 1930, but a large increase in the output of canned tuna and tunalike fishes. The landings of the halibut fleet in 1930 decreased somewhat from those in 1929.

LAKE FISHERIES

The United States fisheries prosecuted in the Great Lakes and the International Lakes of northern Minnesota show an increase in 1929 over the previous year. This increase may be attributed in part to the inclusion of certain products not canvassed in recent surveys and to a change in the methods of collecting statistics in some of the States. The catch of cisco, which was once an important product in the fisheries of Lake Erie, has continued to decrease at an alarming

rate. The catches of lake herring, lake trout, and yellow perch, as well as some of the less important species, have shown recoveries from the small catches of 1928.

MISSISSIPPI RIVER AND TRIBUTARIES

No general survey of the fisheries of this region has been made since 1922, and therefore no recent trend can be determined. The yield of fresh-water mussels, which contributed approximately one-half to the total weight of the catch in 1922, shows an increase in 1930 not only over the production of 1922, but also that of 1929. The fisheries of Lakes Pepin and Keokuk decreased in yield in 1930 as compared with the previous year, but the catch in the Mississippi River between these two lakes shows a gain.

ALASKA

The catch of the fisheries of Alaska in 1930 was somewhat less than in the previous year. There was a decrease in the pack of salmon amounting to 6 per cent, as compared with the pack in 1929. The catch of herring as well as that of halibut was somewhat less than in the previous year. There was an increase in the frozen fish and cured fish activities over 1929.

¹ Data for the Mississippi River and tributaries are for 1922; the pearl-button industry is not included.

² Included on vessels.

³ Includes scows, houseboats, and pile drivers.

⁴ Detailed statistics not available. There were 42 establishments engaged in handling fresh and frozen fish; 103, in curing fish; 158, in canning fish; and 23 in manufacturing by-products. There were 262 plants operating in Alaska exclusive of duplication. There were 16,646 persons employed in these establishments.

⁵ Exclusive of Alaska.

⁶ Data not available.

NOTE.—Figures for 1908 collected by the Bureau of the Census. Figures in italics were obtained from actual canvasses.

CANNED FISHERY PRODUCTS AND BY-PRODUCTS TRADE

The output of canned fishery products and by-products in the United States and Alaska in 1930 was valued at \$106,579,039. Of the total, canned products comprised \$82,858,261 and by-products \$23,720,778, a decrease of 18 per cent in the value of canned products and a decrease of less than one-half of 1 per cent in the value of by-products when compared with the respective values of the same groups for the previous year. (The value of by-products for 1930 is not comparable directly with that for 1929, since statistics on the output of marine pearl-shell products were not obtained in 1929.)

Fishery products were canned at 464 establishments in the United States and Alaska in 1930. The combined output of these canneries amounted to 14,767,186 standard cases. The net weight of the products canned amounted to 576,685,454 pounds.

Canned fishery products or by-products were prepared in 27 States and Alaska during 1930. Alaska ranked first in the value of these products, accounting for 30 per cent of the total. Canned salmon was the leading product manufactured there. California, with her important sardine and tuna canning industries, ranked second with 25 per cent of the total value; and Washington, with an important salmon industry, ranked third with 9 per cent of the total value. Maine, where canned sardines were the most important commodity, ranked fourth with 6 per cent of the total value. Considering the output by geographical sections, the Pacific coast and Alaska accounted for 68 per cent of the total value of canned products and by-products.

CANNED PRODUCTS

The value of fishery products canned during 1930 was 18-per cent less than in the previous year. Salmon was the most important item and contributed 52 per cent to the total value. Sardines and tuna and tunalike fishes followed, each accounting for 16 per cent of the total value. The remainder of the value was made up principally of shrimp, clam products, oysters, sturgeon caviar, and fish cakes, balls, etc.

1 Not enumerated separately prior to 1927.

SALMON

In 1930 salmon was canned at 149 plants in Alaska, 31 in Washington, 12 in Oregon, and 2 in California. Compared with the previous year, this was a decrease of 7 plants in Alaska, 5 in Washington, and 3 in Oregon, and an increase of 1 in California. The combined output of the 194 plants amounted to 6,086,479 standard cases of forty-eight 1-pound cans valued at \$42,835,953. Of the total, 1,054,001 cases, valued at \$13,140,081, were packed in the Pacific Coast States, and 5,032,478 cases, valued at \$29,695,872, in Alaska. The pack in the Pacific Coast States was 35 per cent less than in the year previous due mainly to the smaller pack in the Puget Sound district of hump-back or pink salmon, as 1930 was an "off year." Compared with 1928, the previous "off year," there was an increase of 25 per cent in the pack. The pack in Alaska was 6 per cent less than the previous year.

FIGURE 9.—Value of canned fishery products in the United States and Alaska, 1930

The world pack of canned salmon in 1930 amounted to 10,438,646 cases, which was an increase of 4 per cent as compared with that of the previous year. Of the total, 6,086,479 cases, or 58 per cent of the total, were packed in the United States and Alaska; 2,221,819 cases, or 21 per cent, in British Columbia; 1,751,944 cases, or 17 per cent, in Siberia; and 378,404 cases, or 4 per cent, in Japan.

Compared with the pack in 1929 there was a decrease of 13 per cent in the pack in the United States and Alaska, an increase of 59 per cent in the pack in British Columbia, an increase of 70 per cent in Siberia, and a decrease of 40 per cent in Japan. Statistics on the pack in British Columbia were obtained from the 1931 annual statistical number of the "Pacific Fisherman" and those for Siberia and Japan were obtained from the Mitsubishi Co., Seattle, Wash.

SARDINES

In 1930 sardines were packed at 33 plants in Maine and 29 in California. This is a decrease of 4 plants in Maine, 2 in California, and 1 in Massachusetts, as compared with the number operated during the previous year. The production of sardines in Maine amounted to 1,399,212 standard cases of one hundred $\frac{1}{4}$ -pound cans, valued at \$4,459,071, which is a decrease of 31 per cent in quantity and 35 per cent in value as compared with the pack in the previous year. In California the production amounted to 2,979,333 standard cases of forty-eight 1-pound cans, valued at \$8,741,928, which is a decrease of 22 per cent in quantity and 27 per cent in value. The pack in Maine was considerably below the 10-year average; but that in California, while showing a decrease as compared with the previous year, is considerably over the 10-year average.

TUNA AND TUNALIKE FISHES

In 1930 these fishes were canned in 15 plants in California—a decrease of 2 plants as compared with those operating in 1929. The total pack amounted to 2,010,640 standard cases of forty-eight ½-pound cans, valued at \$13,055,876. This is an increase of 34 per cent in quantity and 32 per cent in value, as compared with the pack in the previous year. The pack was by far the largest on record.

¹ Includes 27,489 cases of tuna flakes, valued at \$120,637.

² Includes 25,353 cases of tuna flakes, valued at \$102,129, which have been credited to the various species as packed.

³ Includes a few cases of mixed tuna of other varieties.

NOTE.—Shown in standard cases of forty-eight 1/2-pound cans.

ALEWIFE PRODUCTS

In 1930 alewives or alewife roe were canned at 9 plants in Maryland, 23 in Virginia, and 2 in North Carolina—a total of 34 plants, or 2 more than in 1929. The output consisted of 73,117 standard cases of canned alewives, valued at \$223,065, and 60,367 cases of alewife roe, valued at \$303,559—a total of 133,484 standard cases of forty-eight 1-pound cans, valued at \$526,624. Considering the total production, there was an increase of 37 per cent in quantity and 21 per cent in value as compared with the pack in the previous year. The pack in 1930 was considerably greater than that of any year for which there is record.

SHRIMP

In 1930 shrimp were canned at 1 plant in North Carolina, 4 in South Carolina, 6 in Georgia, 9 in Florida, 4 in Alabama, 15 in Mississippi, 25 in Louisiana, and 5 in Texas, making a total of 69 plants, or less than in 1929. The total pack amounted to 818,491 standard cases of forty-eight No. 1 cans (5-ounce cans, dry pack, and 5¼-ounce, wet pack), valued at \$4,960,542. This is a decrease of 10 per cent both in quantity and value of the pack as compared with that of the previous year. Louisiana was by far the most important State in the production of canned shrimp, accounting for 49 per cent of the pack.

OYSTERS

In 1930 oysters were canned at 2 plants in Maryland, 3 in North Carolina, 10 in South Carolina, 3 in Georgia, 2 in Florida, 2 in Alabama, 18 in Mississippi, 7 in Louisiana, and 1 in Texas—a total of 48 plants, or 13 less than in 1929. The output of the plants amounted to 396,174 standard cases of forty-eight 5-ounce cans valued at \$1,836,862. This is a decrease of 24 per cent in quantity and 33 per cent in value as compared with the pack and its value for the previous year. The pack in 1930 was less than that in any year since 1921. The production in Mississippi accounted for 57 per cent of the total.

The pack during the spring period (January to May, 1930) amounted to 333,174 standard cases, valued at \$1,605,647, and that during the fall period (September to December, 1930) amounted to 63,000 standard cases, valued at \$231,215. The pack during the spring period of 1929 amounted to 405,004 standard cases, valued at \$2,131,138, and that during the fall period of 1929, 114,141 standard cases, valued at \$601,340.

CLAM PRODUCTS

In 1930 razor clam products were canned at 15 plants in Washington, 5 in Oregon, and 6 in Alaska; hard clam products at 1 plant in Rhode Island, 2 in New York, 1 in New Jersey, 1 in Georgia, 1 in Florida, and 5 in Washington; and soft clam products at 24 plants in Maine and 2 in Massachusetts—a total of 62 plants, or 1 less than a

ear ago. The total production amounted to 558,884 standard cases of 48 No. 1 cans, valued at \$2,666,045, an increase of 1 per cent in quantity and 5 per cent in value as compared with that in 1929. Considered according to varieties of clams, the pack of razor clam products amounted to 75,671 standard cases, valued at \$677,754; hard clams, 298,798 standard cases, valued at \$1,299,189; and soft clam products, 184,415 standard cases, valued at \$689,102. The total value of the pack in 1930 exceeds that of any year since 1921, with the exception of the pack in 1927.

MISCELLANEOUS CANNED FISHERY PRODUCTS

In addition to those products discussed individually above, there were 384,489 standard cases of forty-eight 1-pound cans of miscellaneous canned fishery products, valued at \$3,775,360. Among these products shad were canned at 14 plants, shad roe at 10 plants, mackerel at 15 plants, fish flakes at 6 plants, fish cakes, balls, etc., at 9 plants, miscellaneous fish at 16 plants, salmon eggs (for bait) at 7 plants, sturgeon caviar at 7 plants, whitefish roe and caviar at 5 plants, miscellaneous roe and caviar at 6 plants, crabs at 4 plants, and miscellaneous shellfish at 8 plants.

Compared with the pack of a year ago, the pack of shad and shad roe, which amounted to 15,584 cases, valued at \$111,769, decreased 46 per cent in quantity and 48 per cent in value. The pack of mackerel, which amounted to 109,322 standard cases, valued at \$396,027, decreased 82 per cent in quantity and 84 per cent in value. The pack of fish flakes, which amounted to 62,322 cases, valued at \$617,203, increased 11 per cent in quantity and 8 per cent in value. The pack of fish cakes, balls, etc., amounted to 122,281 cases, valued at \$1,003,501, which is a decrease of 7 per cent in quantity and 8 per cent in value. The pack of miscellaneous canned fish amounted to 23,369 cases, valued at \$117,900, which is a decrease of 16 per cent in quantity and 17 per cent in value. The pack of salmon eggs (for bait) amounted to 3,613 cases, valued at \$96,381, which is a decrease of 17 per cent in quantity and 12 per cent in value. The pack of sturgeon caviar amounted to 7,993 cases, valued at \$1,007,345; that of whitefish roe and caviar 866 cases, valued at \$25,599; and that of miscellaneous roe and caviar 16,300 cases, valued at \$117,161. Comparable statistics covering this group for the previous year are not available, since data on roe and caviar imported and canned in the United States were not included during the previous years. The pack of crabs amounted to 1,545 cases, valued at \$56,370—an increase of 34 per cent in quantity and 85 per cent in value. The pack of miscellaneous shellfish amounted to 21,294 cases, valued at \$226,104, which is an increase of 55 per cent in quantity and 23 per cent in value.

BY-PRODUCTS

In 1930 the total value of by-products, including the products of the menhaden, whaling, fresh-water mussel-shell, and marine pearl-shell industries, amounted to \$23,720,778. This is a decrease of less than one-half of 1 per cent as compared with the production of these products in 1929. However, statistics on the marine pearl-shell products, which amounted to \$4,544,147 in 1930, were not

obtained in 1929. Excluding these products, there was a decrease of 19 per cent as compared with the production in 1929. The scrap and meal group was the most valuable and accounted for 25 per cent of the total value of fishery by-products. Fresh-water mussel-shell products followed, with 21 per cent. The other groups in order were marine pearl-shell products, accounting for 19 per cent; marine animal oils, 18 per cent; oyster-shell products, 11 per cent; and miscellaneous by-products, which included fish glue, herring skins and scales, shark skins, fins, and meat, agar, pickled whale meat, whale-bone, and isinglass, accounted for 6 per cent.

OILS

In 1930 the production of marine animal oils amounted to 14,704,784 gallons, valued at \$4,200,064, which is a decrease of 4 per cent in quantity and 38 per cent in value, as compared with the production of the preceding year. Of the total production, 39 per cent consisted

FIGURE 10.—Value of fishery by-products in the United States and Alaska, 1930

SCRAP, MEAL, ETC.

of pilchard or sardine oil; 25 per cent, herring oil (from Maine and Alaska herring and alewives); 22 per cent, menhaden oil; 10 per cent, whale and sperm oil; and 4 per cent, other marine-animal oils, which include that from cod and cod livers, salmon, shark, tuna, mackerel, and miscellaneous fish cuttings and waste.

In 1930 the production of marine-animal scrap, meal, etc., amounted to 126,605 tons, valued at \$5,976,669. This is a decrease of 11 per cent in quantity and 12 per cent in value as compared with the production in 1929. Of the total production, 26 per cent consisted of dried menhaden scrap and meal, 12 per cent acidulated menhaden scrap and meal, 2 per cent shrimp meal, 57 per cent miscellaneous dried scrap and meal (other than menhaden), and 3 per cent miscellaneous crude or green scrap. The largest item in the miscellaneous dried scrap and meal group was pilchard meal, amounting to 25,938 tons, valued at \$1,414,858.

¹A small quantity of shrimp meal produced in California is included with the production of the Atlantic and Gulf coasts.

²A small quantity of shark oil produced in California is included with the production of the Atlantic and Gulf coasts.

³A small quantity of liquid glue produced by the firm in California is included with the production of the Atlantic and Gulf coasts.

⁴Includes herring skins and scales, shark skins, fins and meat, agar, pickled whale meat, whalebone and isinglass.

NOTE.—The oils produced on the Pacific coast are reported in trade gallons (7½ pounds) and those produced on the Atlantic and Gulf coasts are reported in United States gallons (about 7.74 pounds).

GLUE

In 1930 the production of liquid glue amounted to 526,332 gallons, valued at \$1,242,214. This is a decrease of 3 per cent in quantity and 4 per cent in value as compared with the production of the previous year.

OYSTER-SHELL PRODUCTS

In 1930 oyster-shell products were manufactured at 2 plants in Rhode Island, 1 in Connecticut, 3 in Pennsylvania, 5 in New Jersey, 8 in Maryland, 7 in Virginia, 3 in North Carolina, 5 in South Carolina, 2 in Florida, 2 in Alabama, 6 in Mississippi, 4 in Louisiana, 1 in Texas, and 1 in California—a total of 50 plants, which is the same number as operated during 1929. These plants produced 279,118 tons of crushed oyster shell for poultry feed, valued at \$2,309,544, and 67,938 tons of oyster-shell lime, valued at \$285,708—a total of 347,056 tons, valued at \$2,595,252. Compared with the total production of these products in 1929, there was an increase of 4 per cent in quantity and 3 per cent in value. The production in Louisiana accounted for 36 per cent of the total quantity and 40 per cent of the total value. The production of crushed oyster-shell products was greater in 1930 than in any year since 1921.

FRESH-WATER MUSSEL-SHELL PRODUCTS

In 1930 products manufactured from fresh-water mussel shells were valued at \$5,007,419, which is a decrease of 19 per cent as compared with the value of the production in 1929. Of the total production, 96 per cent of the value consisted of pearl buttons. The remaining products included crushed shell for poultry feed, lime, cut shells, stucco, colored and natural color shells, and shell chips used for decorative purposes and "pearl novelties." The total production of finished pearl buttons from fresh-water mussel shells amounted to 15,433,944 gross, valued at \$4,785,881. The products from the fresh-water mussel-shell industry which were manufactured in Iowa accounted for 71 per cent of the total.

Mussel shells utilized in the above production amounted to 59,490,000 pounds, valued at \$1,092,156. Shells were taken in 17 States in the Mississippi Valley and Great Lakes region. The larger producing States were Arkansas, with 31 per cent of the total shells; Illinois, 14 per cent; Tennessee, 13 per cent; Indiana, 9 per cent; Michigan, 8 per cent; and Iowa, 6 per cent.

² A small production made in other States has been included with Iowa.

MARINE PEARL-SHELL PRODUCTS

In 1930 statistics on the marine pearl-shell industry were obtained for the first time in connection with the canned fishery products and by-products survey. The value of the products of this industry amounted to \$4,544,147. Of this value, pearl buttons alone accounted for 81 per cent, the remaining 19 per cent consisting of novelties, such as buckles, knife and revolver handles, inlays for jewelry, ornaments, etc. Of the total production, New Jersey accounted for 33 per cent of the value and New York 17 per cent. The total production of finished pearl buttons from marine pearl shells amounted to 4,484,393 gross, valued at \$3,699,313.

Marine pearl-shell products were manufactured at 1 plant in Maine, 2 in Massachusetts, 3 in Rhode Island, 4 in Connecticut, 12 in New York, 18 in New Jersey, 2 in Pennsylvania, 1 in Delaware, 1 in Maryland, 1 in Florida, and 4 in California.

MENHADEN INDUSTRY

In 1930, 1 menhaden factory was operated in Connecticut, 2 in New Jersey, 2 in Delaware, 10 in Virginia, 11 in North Carolina, 1 in South Carolina, 1 in Georgia, and 5 in Florida—a total of 33 factories, or 4 less than in 1929. These plants utilized 611,213,000 fish in the

manufacture of 22,666 tons of dry scrap, valued at \$1,084,754; 9,752 tons of fish meal, valued at \$544,717; 15,725 tons of acidulated scrap, valued at \$395,295; and 3,191,265 gallons of oil, valued at \$648,954, making a total value for menhaden products of \$2,673,720. This is a decrease of 26 per cent as compared with the value in the previous year. The value of the production in Virginia accounted for 39 per cent of the total.

CURED FISHERY PRODUCTS TRADE

The production of cured fishery products in the marine and lake sections of the United States and Alaska in 1929 amounted to 119,257,056 pounds, valued at \$18,191,081. Of this amount 75,832,709 pounds, valued at \$7,347,253, were salted; 36,490,815 pounds, valued at \$9,446,612, were smoked; 4,746,634 pounds, valued at \$1,214,205, were dried; and 2,186,898 pounds, valued at \$183,011, were spiced.

Considered according to value, mild-cured salmon was the most important salted product, amounting to 12,433,559 pounds, valued at \$3,547,175. Cod was of second importance accounting for 16,740,982 pounds, valued at \$1,308,319; and Scotch-cure Alaska herring ranked third, amounting to 6,545,125 pounds, valued at \$527,384.

Among the smoked products group, salmon, including kippered salmon, was the most important item with respect to value, amounting

to 8,973,348 pounds, valued at \$3,095,501. The combined production of cisco, chubs, and tullibee ranked second with a production of 8,169,635 pounds, valued at \$2,262,051; and sturgeon ranged third with a production of 1,599,669 pounds, valued at \$1,468,751.

Among the dried products, shrimp was by far the most important item, amounting to 2,727,720 pounds, valued at \$1,052,883. In the spiced group alewives accounted for 1,657,500 pounds, valued at \$63,800. The production of spiced alewives were produced in Pennsylvania and North Carolina; spiced sea herring in Pennsylvania, Washington, and Alaska; spiced lake herring in New York and Minnesota; dried salmon in Alaska; dried shrimp in Louisiana and California; dried squeteagues in Louisiana; and stock fish in Alaska.

SALTED AND SMOKED FISHERY PRODUCTS

Of the total products of the marine and lake sections of the United States and Alaska salted during 1929, the New England section accounted for 39 per cent of the quantity and 27 per cent of the value; the Chesapeake Bay section, 7 per cent of the quantity and 2 per cent of the value; the South Atlantic and Gulf section, 9 per cent of the quantity and 4 per cent of the value; the Pacific Coast section, 20 per cent of the quantity and 37 per cent of the value; the Lakes section, 8 per cent of the quantity and 4 per cent of the value; and Alaska, 17 per cent of the quantity and 26 per cent of the value.

In the smoked fish group the New England section accounted for 32 per cent of the quantity and 15 per cent of the value; the Middle Atlantic section, 41 per cent of the quantity and 60 per cent of the value; Pacific Coast section, 11 per cent of the quantity and 8 per cent of the value; the Lakes section, 16 per cent of the quantity and 17 per cent of the value; and Alaska less than one-half of 1 per cent each of the quantity and value.

NEW ENGLAND SECTION

The production of salted and smoked fishery products in New England in 1929 amounted to 41,452,240 pounds, valued at \$3,387,827. Of this amount, salted fish comprised 29,732,567 pounds, valued at \$1,997,573; and smoked fish 11,719,673 pounds, valued at \$1,390,254.

The production of salted fish was comprised mostly of cod, hake, mackerel, pollock, and haddock; and that of smoked fish principally herring and finnan haddie.

MIDDLE ATLANTIC SECTION

The production of smoked fish in the Middle Atlantic section in 1929 amounted to 14,915,415 pounds, valued at \$5,664,981. This production includes that of two firms in Maryland. Only a small amount of products were salted in the Middle Atlantic section, and these have been included in the Chesapeake Bay-section. The principle products smoked were salmon; cisco, chubs, and tullibee; sturgeon; and finnan haddie.

CHESAPEAKE BAY SECTION

The production of salted products in the Chesapeake Bay section in 1929 amounted to 5,279,925 pounds, valued at \$165,071. This includes a small amount of salted products which were produced in Delaware, but does not include the production of two firms in Baltimore which smoked fish. The output of the latter establishments were included in the Middle Atlantic section. Most of the production of salted products consisted of corned, pickled, and tight-pack cut alewives.

SOUTH ATLANTIC AND GULF SECTION

The production of salted fish in the South Atlantic and Gulf section in 1929 amounted to 6,769,543 pounds, valued at \$283,261. Most of this production consisted of alewives and mullet. No fish were smoked in this section.

PACIFIC COAST SECTION

The production of salted and smoked fish in the Pacific Coast section in 1929 amounted to 18,687,734 pounds, valued at \$3,479,886. Salted fish accounted for 14,762,551 pounds, valued at \$2,718,635; and smoked fish, 3,925,183 pounds, valued at \$761,251.

Mild-cured salmon and dry-salted cod were the most important salted products and kippered salmon was the most important smoked product.

LAKES SECTION

The production of salted and smoked fish in the Lakes section in 1929 amounted to 12,298,300 pounds, valued at \$1,906,008. Of this amount, salted fish comprised 6,372,772 pounds, valued at \$276,912; and smoked fish, 5,925,528 pounds, valued at \$1,629,096. Lake herring was by far the most important of the salted products and cisco, chubs, and tullibee and salmon made up most of the smoked fish group.

ALASKA

The production of salted and smoked fish in Alaska in 1929, amounted to 12,920,367 pounds, valued at \$1,906,831. Of this amount, salted fish comprised 12,915,351 pounds, valued at \$1,905,801; and smoked fish 5,016 pounds, valued at \$1,030. Of the salted products, mild-cured salmon and Scotch-cure herring were the most important. The smoked group consisted entirely of salmon.

¹ Detailed figures can not be given showing the production of spiced and dried fishery products by sections. In general, spiced alewives were produced in Pennsylvania and North Carolina; spiced sea herring in Pennsylvania, Washington, and Alaska; spiced lake herring, in New York and Minnesota; dried salmon, in Alaska; dried shrimp, in Louisiana and California; dried squeteagues, in Louisiana; and stockfish, in Alaska.

² Includes a small quantity of finnan haddie smoked in New Hampshire.

³ The production of Massachusetts has been included with that of Maine.

⁴ The production of Maine has been included with that of Massachusetts.

⁵ Includes pickled mackerel, salted salmon, pickled sea herring, and shad.

⁶ Includes flounders, hake, lake trout, salmon, shad, and whitefish.

⁷ Includes the production of 2 firms in Maryland.

⁸ The production of New Jersey is included with that of New York.

⁹ The production of Pennsylvania is included with that of New York.

¹⁰ Includes smoked alewives and cod filets, kippered salmon, and smoked Russian whitefish.

¹¹ The production of smoked fish, manufactured by 2 firms in Baltimore has been included with Pennsylvania.

¹² Includes a small amount of sturgeon caviar which was produced in Delaware.

¹³ Includes a small production of mullet roe and some salted shrimp which are included under "Other salted products," both of which were produced in Alabama.

¹⁴ Includes the production in Mississippi.

¹⁵ A very small production of Florida has been included with North Carolina.

¹⁶ Includes salted tenpounder, bluefish, spanish mackerel, and shrimp.

¹⁷ Includes salted anchovies, barracuda, mackerel, sablefish, sea bass, whitefish, and yellowtail.

¹⁸ The production of California has been included with that of Washington.

¹⁹ Includes smoked herring and sablefish and kippered sablefish.

²⁰ The production of salted fish in New York has been included with Wisconsin and the production of smoked fish in New York and Ohio has been included with Illinois, Indiana, and Michigan as indicated by footnotes.

²¹ The production of Minnesota is included with Wisconsin.

²² Includes salted suckers and whitefish, and pickled alewives, chubs, and lake herring.

²³ The production of Illinois is included with Wisconsin.

²⁴ The production of Wisconsin as well as that in Ohio is included with Michigan.

²⁵ Includes the production in New York and Ohio.

²⁶ The production of Michigan as well as that of New York is included with Illinois.

²⁷ The production of Michigan is included with Wisconsin.

²⁸ The production of Michigan is included with Minnesota.

²⁹ The production of Michigan as well as that of Ohio is included with Illinois.

³⁰ Includes the production of Ohio.

³¹ Includes smoked butterfish, halibut, and shad.

TIGHT-PACK CUT HERRING

During 1930 there were 6,968,590 pounds of tight-pack cut herring, valued at \$216,753, packed in Maryland and Virginia. Of this amount 825,000 pounds, valued at \$21,300, were packed in Maryland, and 6,143,590 pounds, valued at \$195,453, were packed in Virginia. The pack increased 205 per cent in quantity and 157 per cent in value as compared with the pack of the previous year in these States.

There were 34 firms engaged in the industry, 4 of which were in Maryland and 30 in Virginia.

PACKAGED FISHERY PRODUCTS TRADE

In 1930, fresh, frozen, and smoked packaged fishery products were prepared in 7 plants in Maine, 55 in Massachusetts, 1 in Connecticut, 29 in New York, 4 in Pennsylvania, 7 in Virginia, 1 in North Carolina, 5 in Florida, 1 in Alabama, 5 in Texas, 2 in Ohio, 1 in Michigan, 3 in Washington, 1 in Oregon, and 6 in California—a total of 128 plants or an increase of 16 over those operated in 1929. The production of packaged fish in 1930 amounted to 80,013,572 pounds, valued at \$12,579,664, as compared with 84,396,505 pounds, valued at \$14,812,987, in 1929. This represents a decrease of 5 per cent in the quantity and 15 per cent in the value. It has been estimated that to produce the packaged-fish products prepared in 1930, 200,000,000 pounds of whole fish were utilized.

According to quantity, by far the most important fish packaged was haddock, which accounted for 78 per cent of the total quantity prepared. Following in order they were cod, with 8 per cent; hake, 3 per cent; cusk, 2 per cent; and shrimp, and squeteagues or "sea trout," each, 1 per cent. About 30 other species were packaged in smaller quantities. Prominent among these species of less importance were flounders and croakers.

The combined production of Massachusetts and Connecticut accounted for 83 per cent of the total output; New York, 7 per cent; Virginia and North Carolina, 3 per cent; Maine, 3 per cent; and Texas, 2 per cent. The total production in all other States amounted to less than 2 per cent of the total.

Considered according to the method of preparation, fillets accounted for 92 per cent of the total; dressed or pan-dressed fish, 3 per cent; steaks, 2 per cent; and sticks, 1 per cent. In addition, shellfish, accounting for 2 per cent of the total, were packaged. Of the total quantity, 69 per cent were marketed fresh, 28 per cent frozen, and 3 per cent smoked.

¹ A small amount of blue pike packaged in New York has been included with Pennsylvania, Ohio, and Michigan.

² A small amount of cod packaged in Virginia has been included with New York.

³ A small amount of flounders packaged in Florida has been included with Virginia and North Carolina.

⁴ A small amount of mackerel packaged in California has been included with Massachusetts and Connecticut.

⁵ A small amount of pollock packaged in New York has been included with Massachusetts and Connecticut.

⁶ A small amount of squeteagues packaged in Florida has been included with Virginia and North Carolina.

⁷ A small amount of wolfish packaged in Maine has been included with Massachusetts and Connecticut.

⁸ Includes abalone, amberjack, bluefish, cisco, lake trout, mullet, sablefish, scallops, shad, snook, Spanish mackerel, swordfish, and whitefish.

⁹ Of this amount, 73,753,075 pounds, valued at \$11,607,880, were fillets; 2,599,114 pounds, valued at \$291,212, were dressed or pan dressed; 1,169,253 pounds, valued at \$282,589, were steaks; 947,318 pounds, valued at \$160,917, were sticks; and 1,544,812 pounds, valued at \$237,066, were shellfish. Of the total quantity of fillets prepared, 50,859,602 pounds, valued at \$8,037,133, were fresh; 20,319,329 pounds, valued at \$3,122,446, were frozen; and 2,574,144 pounds, valued at \$448,301, were smoked. Of the dressed and pan dressed all were marketed fresh, with the exception of 130,967 pounds, valued at \$15,327, which were frozen, and a few pounds that were smoked. Of the steaks, 1,067,198 pounds, valued at \$265,000, were fresh; and 102,055 pounds, valued at \$17,589, were frozen. Of the sticks, 828,350 pounds, valued at \$141,874, were fresh; and 118,968 pounds, valued at \$19,043, were frozen. The scallops and shrimp were marketed frozen.

² Cusk, and pollock are included with hake.

FROZEN-FISH TRADE

FISH, FROZEN

In 1930 the freezing plants in the United States and Alaska, reporting their activities to the Government, packed 139,297,228 pounds of frozen fishery products. These products at the time they were held in cold-storage plants were estimated to be valued at \$16,500,000. This is the largest frozen pack of fishery products on record and exceeded the volume of the pack in 1929 by 15 per cent. Over 60 per cent of the pack consisted of six groups of fishery products. Of first importance was the cod, haddock, haddock filets, hake, and pollock group with 17 per cent of the total. Haddock filets accounted for the bulk of the volume of this group. Of next importance were the salmons, with 12 per cent of the total. Halibut made up 10 per cent of the total; mackerel, 8 per cent; whiting, 7 per cent; and sea herring, 6 per cent. Considerable quantities of shellfish; squid; weakfish, including southern "sea trout"; sablefish or black cod; and cisco or lake herring, including bluefin, blackfin, and chub, also were frozen. Frozen squid and sea herring are marketed primarily for bait, although quantities of each are used for human consumption.

The above pack of frozen fish does not represent the entire amount of fish frozen in the United States, for there are many small private freezers which do not report their activities to the Government. During late years a considerable number of privately owned freezing establishments have been preparing frozen packaged fishery products. The larger of these establishments are now reporting their activities to the Government although a few of the smaller firms still make no report on their activities. However, it is estimated that the figures presented herewith cover about 98 per cent of the trade.

An idea of the production of frozen packaged fish may be obtained from the review on the packaged-fish trade shown elsewhere in this report. In brief, according to this, the frozen pack of packaged fishery products in 1930 amounted to 22,216,131 pounds, valued at \$3,411,471. This is an increase of 2 per cent when compared with the volume of these products packed in 1929.

Among the important species by volume frozen in 1930, those in the ground-fish group increased 114 per cent, salmon 28 per cent, whiting 7 per cent, and mackerel 2 per cent over the frozen pack in 1929. Those of halibut and sea herring fared less well, the pack of each decreasing 4 per cent under that in 1929. Unusual increases are noted in the packs of some of the minor species, conspicuous among which is the blue and sauger pike group, which increased 118 per cent over the pack in 1929. That of suckers increased 68 per cent, and weakfish 62 per cent. Considered as a whole there were greater quantities of the various salt-water species frozen in 1930 than in the preceding year, and a trifle less quantity of the fresh-water species.

That frozen fishery products are becoming an established article of diet in the American household is attested by the fact that greater

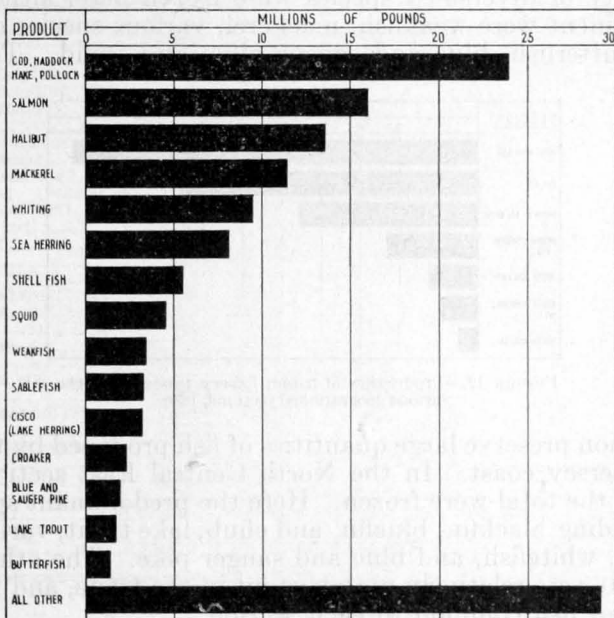

FIGURE 11.—Production of frozen fishery products in the United States and Alaska, 1930

quantities of frozen fishery products were withdrawn from cold-storage plants and entered consumption in 1930 than during the year 1929. This is due, principally, to the increased amount of packaged haddock fillets which entered consumption.

As a general rule most species of fish are frozen during the season when they are in abundance, which is generally during the late spring and summer months of the year. During 1930 over one-half of the frozen pack was put up during the months of May to August inclusive. The amounts frozen during July and August were about equal, each accounting for about 16 per cent of the total. The amounts frozen each month from September to December, inclusive, varied between 5 and 10 per cent. The amounts frozen during the months of January to April, inclusive, were equal, each accounting for about 3 per cent of the total.

The New England section led in the volume of fish frozen during 1930, having 52,624,000 pounds put up there, which was over one-third of the total pack. Haddock fillets was the most important product frozen in the New England section, accounting for about one-third of the total amount of fish frozen there. This product, including the volume of other ground fish, sea herring, mackerel, squid, and whiting accounted for nearly 90 per cent of the fish frozen in this section. In the Pacific section, including Alaska, 38,192,000 pounds were frozen, which is a little more than one-fourth of the total pack. Salmon and halibut were by far the most important species frozen in this section, these accounting for nearly 70 per cent of the production of this section. In the Middle Atlantic section 22,847,000 pounds were frozen, or a little less than one-sixth of the total. A large variety of diversified species were frozen here, although those most prominent were weakfish, mackerel, various species of shellfish, whiting, butterfish, blue and sauger pike, and squid. The freezers

FIGURE 12.—Production of frozen fishery products in the various geographical sections, 1930

in this section preserve large quantities of fish produced by traps along the New Jersey coast. In the North Central East section about 8 per cent of the total were frozen. Here the predominant species were cisco, including blackfin, bluefin, and chub, lake trout, various species of shellfish, whitefish, and blue and sauger pike. The other sections during 1930 were relatively unimportant in the trade, and froze small quantities of fish common to each section.

The freezing plants in the New England sections were busiest from May to October, inclusive: those in the Pacific section during the months from June to November, inclusive: those in the Middle Atlantic section from May to November, inclusive. In the South Atlantic States the busiest season was during the months of May to August, inclusive, and in the North Central East section, during the months of May, November, and December. The amount of fish frozen monthly in the North Central section was fairly uniform, as were the amounts frozen monthly in the South Central section.

¹ Including steelhead trout.² Including haddock fillets.

HOLDINGS

During 1930 the average monthly holdings of frozen fish and shellfish increased 12 per cent over the average monthly holdings during 1929, and 25 per cent over the 5-year average of monthly holdings. Individual monthly holdings during the year were all above normal when compared with the 5-year average, being from 4 to 39 per cent higher. Compared with the respective monthly holdings in 1929 they were from about 1 to 26 per cent greater during 10 months of the year, and 6 to 20 per cent less during the remaining 2 months of the year.

Monthly holdings in 1930 were largest from July to December, inclusive, being, in some instances, three to nearly four times those for certain months from January to June, inclusive. A maximum of 91,872,000 pounds were held on November 15, and a minimum of 25,357,000 pounds on April 15. Holdings during the year averaged 62,430,000 pounds monthly.

On the average the monthly holdings in the New England section were largest in 1930, amounting to 17,914,000 pounds. Large quantities of frozen packaged fish were held in this section. Monthly holdings in the Pacific section were second largest and amounted to 14,551,000 pounds. Monthly holdings in the Middle Atlantic section were third largest and amounted to 13,497,000 pounds on the average. The large holdings in this section are due to the imports from other sections, where they are stored pending sale in the large consumption centers in the Middle Atlantic section. The monthly holdings in the other sections averaged between 1,003,000 pounds and 8,322,000 pounds.

Comparison of the holdings of various important species during the year 1930 with normal (average 1925 to 1929) holdings of these stocks, shows data of interest. With halibut it is found that during each month in 1930 the holdings were below normal except during the months of January, February, November, and December. Those of sea herring were below normal during the first four months of the year, and then above normal for the remainder of the year. Those of lake trout were below normal during the months of January, February, September, October, November, and December. Those of mackerel were above normal for the first three months of the year, then slumped below normal for the next three months, and returned to considerably above normal for the remainder of the year with the exception of November and December, when they were slightly below normal. Those of salmon were somewhat below normal during the first six months of the year, and then during the latter six months holdings increased at an unusual rate. Those of squid were considerably below normal from January to April, inclusive. During this period the shortage of squid for bait became rather acute. However, from May to December the holdings increased and were considerably above normal. The holdings of whiting were considerably above normal every month during the year except during May, when they were practically normal.

Monthly holdings of certain species of frozen fish in 1930 and normal monthly holdings (average 1925-1929)

HOLDINGS OF CURED FISH

Only cured herring and mild-cured salmon are reported held in cold-storage warehouses in the United States and Alaska. Other species are also held in cold-storage, but no report is made on them to the Government as their volume reaches but small proportions. During 1930 the monthly holdings of cured herring varied between 12,115,000 pounds in April and 19,067,000 pounds in October. Monthly holdings of mild-cured salmon varied between 2,464,000 pounds in May and 7,516,000 pounds in October. The average monthly holdings of cured fish held in cold-storage in 1930 were 22 per cent less than the average monthly holdings during the year 1929, and 15 per cent below the average normal monthly holdings.

The respective monthly holdings in 1930 compared with the respective monthly holdings in 1929 show decreases of from 8 to 41 per cent. Compared with the respective normal monthly holdings there were decreases of from 10 to 30 per cent.

FOREIGN FISHERY TRADE

The volume of foreign trade in fishery products in the United States in 1930 amounted to \$68,105,230 of which \$50,829,653 represents the value of those products imported for consumption, and \$17,275,577 the value of exports of domestic fishery products. Compared with the previous year, this is a decrease of 25 per cent in the total trade, a decrease of 24 per cent in the value of imports, and a decrease of 28 per cent in the value of exports.

Imports consisted of 338,486,501 pounds of edible products (including fresh, frozen, cured, and canned fish and shellfish), valued at \$35,035,999 and nonedible products (comprised mainly of marine animal oils, pearls, imitation pearls, shells and buttons of pearl or shell), valued at \$15,793,654. Compared with 1929 this is a decrease of 5 per cent in the quantity and 9 per cent in the value of edible products imported, and a decrease of 43 per cent in the value of nonedible products imported. Decreases in the value of edible products imported were apparent in all classification groups except in the frozen, prepared, or preserved fish roe group wherein there was a small increase. All groups of nonedible products decreased as compared with the previous year.

Fishery exports consisted of edible products amounting to 167,173,475 pounds, valued at \$16,983,338 and nonedible products valued at \$292,239. Compared with the previous year this is a decrease of 22 per cent in the quantity and 28 per cent in the value of edible products exported and a decrease of 11 per cent in the value of nonedible products exported.

Considering the balance of trade in the various groups of fishery products, the imports of fresh and frozen fish in 1929 were about 20 times the exports, which is practically the same ratio as in the year previous; the imports of salted, dried, smoked, or preserved fish were practically the same as the exports in 1929, whereas the exports were slightly greater in the previous year. The imports of canned and fresh shellfish in 1929 were about 3 times the exports, while in the previous year, they were slightly over twice as much. The exports of other edible fishery products in 1929 were 7 times the imports, which is a considerably larger ratio than in the previous year.

The imports of marine animal oils in 1929 were about 16 times the exports, which is a larger ratio than in the previous year.

Exports of domestic fishery products, 1929 and 1930

¹ Statistics of imports from January 1 to June 17 are shown separate from those for the period June 18 to December 31, as the tariff act of 1930 was effective on June 18. This act was responsible for numerous changes in classification of fishery products.

² Prior to June 18, 1930, these products were included in other classifications.

³ These products included in other classifications since June 18, 1930.

FISHERIES OF THE NEW ENGLAND STATES

During 1929 the value of the catch of fishery products in the New England States (Maine, New Hampshire, Massachusetts, Rhode Island, and Connecticut) exceeded that in any year for which there

FIGURE 13.—Yield of principal fishery products in the New England States, 1929

are records. This was due mainly to the increased production of haddock. These fisheries gave employment to 17,160 fishermen, or 3 per cent more than in 1928. Of the total number of fishermen employed during 1929, 6,199 regular fishermen were engaged on vessels, and 9,330 regular and 1,631 casual fishermen were employed in the shore and boat fisheries. Their catch amounted to 694,286,086 pounds, valued at \$29,072,566. This is an increase of 15 per cent in the catch and 13 per cent in the value of the catch as compared with the quantity and its value for 1928. Of the total catch in 1929, 646,541,278 pounds, valued at \$20,881,104, were fish, and 47,744,808 pounds, valued at \$8,191,462, were shellfish and miscellaneous products.

Based on the value to the fishermen, haddock with a production of 255,851,532 pounds, valued at \$8,950,643, was the most important product. Lobsters were second with a production of 10,322,466 pounds, valued at \$3,132,198. Other products of importance were cod, 86,999,326 pounds, valued at \$2,919,164; mackerel, 62,272,733 pounds, valued at \$2,302,595; flounders, 48,933,312 pounds, valued at \$2,145,958; all varieties of clams, 12,575,812 pounds of meats, valued at \$1,991,711; and oysters, 11,349,962 pounds of meats, valued at \$1,984,251. Other products were valued individually at less than \$1,000,000.

The industries related to the fisheries of the New England States gave employment to 13,815 persons, of whom 404 were engaged in transporting fishery products, 3,595 were in the wholesale trade and received \$5,285,740 in salaries and wages, 7,872 were in the manufacturing industry and received \$3,651,253 in salaries and wages, and 1,944 were fishermen who prepared fishery products and are duplicated in the total number of fishermen employed as shown above. There were 292 establishments in the wholesale trade handling primary products and 162 establishments were in the manufacturing industry. The latter manufactured products—mostly canned sardines, clams, and other canned fishery products—to the value of \$15,888,289. In addition, the fishermen prepared fishery products valued at \$111,145. Most of these products were salt fish prepared aboard vessel from the various species of ground fish.

¹ Includes 1 transporter and 2 wholesale firms operating in Rockingham County, N. H.

² Statistics relative to persons and compensation for 3 firms which were engaged in manufacturing functions are included under "wholesale." One of these was exclusively a manufacturer and the other 2 manufactured only incidentally.

³ Statistics relative to persons and compensation for 4 firms which were engaged in manufacturing functions are included under "wholesale." One of these was exclusively a manufacturer and the 3 others manufactured only incidentally.

MAINE

The fisheries and industries related to the fisheries of Maine in 1929, including 1 transporter and 2 wholesale firms in New Hampshire, employed 12,550 persons. This is 35 per cent more than the number employed in these fisheries during 1928. Of the total number of persons, 5,593 were fishermen, 235 were employed on transporting

vessels, 372 in the wholesale trade, and 6,350 in manufacturing industries. Of the fishermen 429 also were engaged in the manufacture of prepared fishery products.

The total catch amounted to 162,939,491 pounds, valued at \$4,897,170. This is an increase of 32 per cent in the catch and 16 per cent in the value of the catch, as compared with the catch and its value for 1928. Of the total value of the catch, that of lobsters accounted for 40 per cent; cod, 11 per cent; clams, 10 per cent; and haddock and sea herring, each 9 per cent. Of the total weight of the catch, that of sea herring accounted for 56 per cent; cod, 11 per cent; haddock, 9 per cent; hake, 6 per cent; and clams and lobsters, each 4 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Maine during 1929 was taken by 5,593 fishermen who used 79 motor vessels, 5,601 motor and other small fishing boats, and 20 major types of gear. The vessels had a combined capacity of 1,007 net tons. The fisheries accounting for the greatest number of persons were the lobster-pot fishery employing 2,275 fishermen, the hand-line fishery employing 1,468 fishermen, the fishery with forks employing 1,290 fishermen, and the trawl-line fishery employing 1,092 fishermen.

CATCH BY GEAR

Four types of gear accounted for 83 per cent of the fishery products taken in the marine fisheries of Maine during 1929. Listed in order of their importance they were: Weirs, which accounted for 30 per cent of the catch; lines, 24 per cent; purse seines, 15 per cent; and haul seines, 14 per cent. The catch by weirs was principally herring; that by lines was chiefly haddock, cod, hake, pollock, and cusk; that by purse seines, principally herring and mackerel; and that by haul seines, almost exclusively herring.

OPERATING UNITS BY COUNTIES

Hancock County was foremost in the number of persons fishing, accounting for 31 per cent of the total. Washington County followed with 20 per cent. Other counties employing a considerable number of fishermen were Cumberland, Knox, and Lincoln. Cumberland County accounted for 42 per cent of the total number of fishing vessels, and Knox County followed with 27 per cent. Hancock County led in the number of motor and other small fishing boats, accounting for 26 per cent of the total. Washington followed with 25 per cent.

CATCH BY COUNTIES

Fishing was prosecuted in the marine waters of 10 counties in Maine during 1929. Ranked according to value the fisheries of Cumberland County were most important, accounting for 21 per cent of the total catch and 24 per cent of the total value of the catch. Knox County was next in the value of the catch accounting for 21 per cent of the total quantity and 20 per cent of the total value. Other important counties listed in order of their importance with respect to the value of the catch were Hancock, Washington, and Lincoln.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 235 persons in Maine engaged primarily in transporting fishery products by means of vessels. In this trade 2 steam vessels and 117 motor vessels, having a combined capacity of 1,257 net tons, were operated. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 91 wholesale establishments in Maine engaged primarily in handling fresh and frozen products. These establishments employed 372 persons, who received \$447,299 in salaries and wages. Knox County alone accounted for 28 of these establishments.

Manufacturing.—There were 126 establishments in Maine in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 6,350 persons, who received \$1,672,971 in salaries and wages. The products manufactured, consisting principally of salted, smoked, and canned fishery products, were valued at \$9,293,013. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095 entitled "Fishery Industries of the United States, 1929."

Fishermen's prepared products.—In addition to the output of prepared products by manufacturing firms, there were 429 fishermen in Maine who prepared fishery products. Their output consisted principally of salted and smoked fish amounting to 914,349 pounds, valued at \$31,592.

³ Includes a small quantity of fish smoked in Rockingham County, N. H.

⁴ Includes the production of 11 firms whose activities were principally in the wholesale industry.

⁵ A standard case contains one hundred $\frac{3}{4}$ -pound cans of sardines, 48 No. 1 cans of clam products, or forty-eight 1-pound cans of miscellaneous fishery products.

⁶ Includes dried sounds, herring skins, and scales, tanners oil, and kelp products.

NEW HAMPSHIRE

The fisheries of New Hampshire in 1929 employed 51 persons, which is 4 per cent less than the number employed in 1928. Only 1 transporter and 2 wholesale plants were operated in this State; therefore the vessel and the number of persons engaged, salaries and wages, and products of these establishments are included under Maine. The entire number of persons shown above were fishermen.

The total catch amounted to 378,048 pounds, valued at \$52,071. This is an increase of 58 per cent in the catch and 16 per cent in the value of the catch, as compared with the catch and its value in 1928. Of the total value of the catch, lobsters accounted for 80 per cent and haddock 7 per cent. Of the total weight of the catch, lobsters accounted for 33 per cent; haddock, 24 per cent; and alewives, 15 per cent. The fisheries of New Hampshire are confined to Rockingham County.

OPERATING UNITS BY GEAR

The catch of fishery products in the marine waters of New Hampshire during 1929 was taken by 51 fishermen, 77 motor and other small fishing boats, and 4 major types of gear. The lobster pot fishery alone accounted for 41 of the fishermen.

CATCH BY GEAR

Two types of gear accounted for 73 per cent of the fishery products taken in the marine fisheries of New Hampshire during 1929. Of these gears, lines were the most important, accounting for 40 per cent of the catch. Lobster pots followed with 33 per cent. The catch by lines was principally cod, haddock, hake, and pollock, and that by lobster pots was exclusively lobsters.

MASSACHUSETTS

The fisheries and industries related to the fisheries of Massachusetts in 1929 employed 12,188 persons, which is 11 per cent more than the number employed in 1928. Of the total number of persons, 8,402 were fishermen, 98 were employed on transporting vessels, 2,166 in the wholesale trade, and 1,522 in manufacturing industries. Of the fishermen, 1,515 were also engaged in the manufacture of prepared fishery products.

The total catch amounted to 447,689,124 pounds valued at \$18,052,486. This is an increase of 18 per cent in the catch and 15 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, that of haddock accounted for 40 per cent; cod, 12 per cent; mackerel, 11

per cent; and flounders, 8 per cent. Of the total weight of the catch, that of haddock accounted for 48 per cent; cod, 14 per cent; mackerel, 12 per cent; and flounders, 8 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Massachusetts during 1929 was taken by 8,402 fishermen, who used 413 motor vessels, 1 sailing vessel, 24 steam vessels, 2,810 motor and other small fishing boats, and 19 major types of gear. The vessels had a combined capacity of 17,601 net tons. The fisheries accounting for the greatest number of persons were the otter-trawl fishery, employing 2,967 fishermen; the trawl-line fishery, employing 1,661 fishermen; the harpoon fishery, employing 1,140 fishermen; and the purse-seine fishery, employing 1,017 fishermen.

CATCH BY GEAR

Three types of gear accounted for 86 per cent of the fishery products taken in the marine fisheries of Massachusetts during 1929. Listed in order of their importance they were: Otter trawls, which accounted for 54 per cent of the catch; lines, 22 per cent; and purse seines, 10 per cent. The catch by otter trawls and lines was principally fish of the ground-fish group, and that by purse seines was principally mackerel.

OPERATING UNITS BY COUNTIES

Suffolk County was foremost in the number of persons fishing, accounting for 31 per cent of the total. Essex County followed with 29 per cent. Other counties employing a considerable number of fishermen were Barnstable, Bristol, and Plymouth. Suffolk County accounted for 42 per cent of the total number of fishing vessels, and Essex County followed with 33 per cent. Barnstable County led in the number of motor and other small fishing boats, accounting for 33 per cent of the total. Essex and Plymouth Counties followed in order, accounting for 18 per cent and 17 per cent, respectively, of the total number.

CATCH BY COUNTIES

Fishing was prosecuted in the marine waters of 8 counties in Massachusetts during 1929. Ranked according to value, the fisheries of Suffolk were most important, accounting for 53 per cent of the total catch and 45 per cent of the total value of the catch. Essex County was next in the value of the catch, accounting for 29 per cent each of the total quantity and value. Other important counties, listed in order of their importance with respect to the value of the catch, were Barnstable and Bristol.

Fisheries of Massachusetts, 1929

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 98 persons in Massachusetts engaged primarily in transporting fishery products by means of vessels. In this trade 16 motor vessels and 4 sailing vessels, having a combined capacity of 885 net tons, were operated. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 143 wholesale establishments in Massachusetts engaged primarily in handling fresh and frozen products. These establishments employed 2,166 persons, who received \$3,512,992 in salaries and wages. Suffolk County alone accounted for 92 of these establishments.

Manufacturing.—There were 36 establishments in Massachusetts in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 1,522 persons, who received \$1,978,282 in salaries and wages. The products manufactured, consisting principally of cured and canned fish and liquid glue, were valued at \$6,030,304.

Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, "Fishery Industries of the United States, 1929."

Fishermen's prepared products.—In addition to the output of prepared products by manufacturing firms, there were 1,015 fishermen in Massachusetts who prepared fishery products. Their output, consisting principally of salted cod, herring, and mackerel, amounted to 1,966,804 pounds, valued at \$79,553.

¹ Includes the production of 6 firms whose activities were principally in the wholesale industry.

² A "standard case" represents the various sized cases converted to the equivalent of forty-eight 1-pound cans to the case.

³ Includes finnan haddie, haddock chowder, fish cakes, fish flakes, fiskeboller, ready-to-try, ready-to-serve, fish for cats and dogs, and deep sea roe.

⁴ Includes miscellaneous oil, isinglass, and mussel-shell products.

RHODE ISLAND

The fisheries and industries related to the fisheries of Rhode Island in 1929 employed 1,907 persons, which is 14 per cent more than the number employed in the previous year. Of the total number of persons, 1,406 were fishermen, 61 were employed on transporting vessels, and 440 in the wholesale and manufacturing industries.

The total catch amounted to 28,401,268 pounds, valued at \$2,435,-346, which is an increase of 3 per cent in the catch and 2 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, that of oysters accounted for 21 per cent; clams, 18 per cent; lobsters, 14 per cent; and flounders, 9 per cent. Of the total weight of the catch, that of flounders accounted for 17 per cent; cod, 9 per cent; whiting, sea herring, and oysters, each 8 per cent; mackerel and squid, each 7 per cent; and scup or porgy, 6 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Rhode Island during 1929 was taken by 1,406 fishermen, who used 80 motor vessels, 1,019 motor and other small fishing boats, and 17 major types of gear. The vessels had a combined capacity of 917 net tons. The fisheries accounting for the greatest number of persons were the fishery by tongs, employing 443 fishermen; the lobster-pot fishery, employing 400 fishermen; and the hand-line fishery employing 216 fishermen.

CATCH BY GEAR

Five types of gear accounted for 81 per cent of the fishery products taken in the marine fisheries of Rhode Island during 1929. Listed in order of their importance, they were: Floating traps, which accounted for 34 per cent of the catch; otter trawls, 19 per cent; hand lines, 11 per cent; dredges, 9 per cent; and purse seines, 8 per cent. The catch by floating traps was principally whiting, squid, scup, mackerel, and butterfish; that by otter trawls, chiefly flounders; that by lines, mainly cod and haddock; that by dredges, principally oysters; and that by purse seines, herring and mackerel.

OPERATING UNITS BY COUNTIES

Newport County was foremost in the number of persons fishing, accounting for 47 per cent of the total. Kent County followed with 20 per cent. Other counties employing a considerable number of fisherman were Washington and Providence. Newport County alone accounted for 68 per cent of the fishing vessels. It also accounted for 41 per cent of the motor and other small fishing boats. Kent County accounted for 29 per cent of the small fishing boats.

CATCH BY COUNTIES

Fishing was prosecuted in the marine waters of five counties in Rhode Island during 1929. Ranked according to their value, the fisheries of Newport County were most important, accounting for 71 per cent of the total catch and 48 per cent of the total value of the catch. Washington County was next in value of the catch, accounting for 16 per cent of the quantity and 16 per cent of the value. The next county in importance was Kent, followed in order by Bristol and Providence.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 61 persons in Rhode Island engaged primarily in transporting fishery products by means of vessels. In this trade 10 motor vessels, having a combined capacity of 202 net tons, were operated. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale and manufacturing.—There were 34 wholesale establishments engaged primarily in handling fresh and frozen products, and 1 establishment engaged primarily in the manufacture of canned products. These establishments gave employment to 440 persons who received \$399,713 in salaries and wages. The products manufactured, consisting principally of canned clam products and oyster-shell products, were valued at \$344,929.

¹ Statistics relative to persons engaged and compensation for three firms which were engaged in manufacturing functions are included in this table. One of these was exclusively a manufacturer and the other two only manufactured incidentally. The products manufactured, consisting principally of canned clam products and oyster-shell products, were valued at \$344,929.

CONNECTICUT

The fisheries and industries related to the fisheries of Connecticut in 1929 employed 2,335 persons, which is 7 per cent less than the number employed in 1928. Of the total number of persons, 1,708 were fishermen, 10 were employed on transporting vessels, and 617 in the wholesale and manufacturing industries.

The total catch amounted to 54,878,155 pounds, valued at \$3,635,-493, which is a decrease of 24 per cent in the catch but a gain of 10 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, that of haddock accounted for 36 per cent; oysters, 35 per cent; flounders, 9 per cent; and lobsters, 6 per cent. Of the total weight of the catch, that of haddock accounted for 51 per cent; oysters, 16 per cent; flounders, 15 per cent; and cod, 5 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Connecticut during 1929 was taken by 1,708 fishermen, who used 99 motor vessels, 4 sailing vessels, 31 steam vessels, 792 motor and other small fishing boats, and 16 major types of gear. The vessels had a combined capacity of 6,905 net tons. The fisheries accounting for the greatest number of persons were the otter-trawl fishery, employing 599 fishermen, and the oyster-dredge fishery, employing 349 fishermen.

CATCH BY GEAR

Two types of gear accounted for 87 per cent of the fishery products taken in the marine fisheries of Connecticut during 1929. In order of their importance they were: Otter trawls, which accounted for 72 per cent of the catch; and oyster dredges, 15 per cent. The catch by otter trawls was principally haddock, flounders, and cod, and that by oyster dredges was exclusively oysters.

OPERATING UNITS BY COUNTIES

New London County was foremost in the number of persons fishing, accounting for 50 per cent of the total. New Haven County, followed, with 18 per cent. New London County also led in the number of fishing craft, accounting for 49 per cent of the vessels and 40 per cent of the motor and other small fishing boats.

CATCH BY COUNTIES

Fishing was prosecuted in the marine waters of six counties of Connecticut during 1929. Ranked according to value, the fisheries of New London County were by far the most important, accounting for 81 per cent of the total catch and 59 per cent of the total value of the catch. New Haven County accounted for 9 per cent of the catch and 21 per cent of the value. Fairfield and Middlesex Counties followed in order of importance with respect to value of the catch.

¹ The catch is for New London County, except for 117 pounds of shad, valued at \$12, which was taken in Tolland County.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 10 persons in Connecticut engaged primarily in transporting fishery products by means of vessels. In this trade five motor vessels, having a combined capacity of 44 net tons, were operated.

Wholesale and manufacturing.—There were 22 wholesale establishments engaged primarily in handling fresh and frozen products and one establishment engaged primarily in the manufacture of fishery by-products. These establishments employed 617 persons, who received \$925,736 in salaries and wages. Manufactured products, consisting of menhaden products, fish meal from ground fish, cod and cod-liver oil, and oyster-shell products were valued at \$220,043.

¹ Statistics relative to persons engaged and compensation for 4 firms which were engaged in manufacturing functions are included in this table. One of these was exclusively a manufacturer and the other 3 only manufactured incidentally. The products manufactured, consisting of menhaden products, fish meal from ground fish, cod and cod-liver oil and oyster-shell products, were valued at \$220,043.

HISTORICAL REVIEW

Twelve general surveys have been made for statistics of the fisheries of the New England States in the 50 years from 1879 to 1929. The catch in 1929, which amounted to 694,286,000 pounds exceeded that in any year for which there are records, surpassing the previous peak year of 1889. Comparative statistics of the catch of each of the more important species are shown in the following tables.

Fisheries of the New England States, 1879 to 1929

¹ Not available. Prior to 1889 some of these species were included under "Miscellaneous fish" or "All other species."

² Less than 500 pounds.

³ Shown on the basis of 8 pounds of meat to the bushel.

⁴ Shown on the basis of 10 pounds of meat to the bushel.

⁵ Included with soft clams.

⁶ Includes hard clams.

⁷ Shown on the basis of 7 pounds of meat to the bushel.

⁸ Shown on the basis of 6 pounds of meat to the bushel.

NOTE.—It is possible that in some instances since 1889 a few of the above species are not shown by reason of being included under "Miscellaneous fish" or "All other species."

VESSEL FISHERIES AT PRINCIPAL NEW ENGLAND PORTS

ECONOMIC ASPECT

The landings of fishery products at the three principal New England ports (Boston and Gloucester, Mass., and Portland, Me.) by vessels of 5 net tons and over, during 1930, amounted to 350,801,470 pounds as landed, valued at \$12,785,452. This exceeded the amount landed for any year for which records are available, exceeding the amount landed in 1929 by 7 per cent. However, the value of the landings were 2 per cent less than the value of the fish landed in 1929. Of the total landings, 99 per cent consisted of fresh fish and 1 per cent of salted fish. The landings at Boston accounted for the lion's share of those landed at the three ports in 1930, accounting for 285,257,478 pounds, valued at \$10,870,586, or 81 per cent of the total quantity. This is an increase over 1929 of 11 per cent in amount but only 1 per cent in value. Landings at Gloucester in 1930 amounted to 47,359,467 pounds, valued at \$1,348,087, or 14 per cent of the total quantity. This is a decrease of 12 per cent in amount and 11 per cent in value compared with the amount and value of the landings at this port in 1929. At Portland, 18,184,525 pounds of fishery products, valued at \$566,779 were landed. This was 5 per cent of the total landings at the three ports in 1930. It represents an increase of 4 per cent in amount, and a decrease of 7 per cent in value compared with the landings in 1929.

Species landed.—Among the landings of fresh fish, haddock far out-ranked other species in volume landed, the amount of all sizes in 1930 being 189,371,333 pounds, or 55 per cent of the total fresh fish. This is an increase of only 1 per cent over the amount landed in 1929. Of the total haddock landed 52 per cent were taken from Georges Bank, 26 per cent from South Channel, and 11 per cent from Browns Bank. The remainder (except for 9,593,470 pounds which were taken on banks off Canada) were taken from various other banks off the United States, principally on Nantucket Shoals and those near the shore.

Cod was of next importance, although a very poor second. The landings of all sizes of this species fresh amounted to 64,528,811 pounds, or 19 per cent of the total amount of fresh fish landed at the three ports in 1930. This is an increase of 30 per cent compared with the landings of fresh cod at the three ports in 1929. Cod was taken chiefly on Georges Bank, where 43 per cent of the catch was made. Considerable quantities were also taken on South Channel, Browns Bank, and various fishing banks along the shore.

Mackerel landings, fresh, amounted to 33,433,723 pounds at the three ports, or about 10 per cent of the total landings of fresh fish. This is a decrease of 11 per cent compared with the landings in 1929. This amount is 77 per cent of the total catch of mackerel by the United States Atlantic mackerel fleet.

Hake, with landings of 15,613,523 pounds, or 4 per cent of the total fresh-fish landings, ranked fourth in importance and increased 30 per cent over the landings of this species during the previous year.

Flounders, a species which have become popular in the fishery during the past few years, ranked fifth in importance among the fresh fish, with landings of 14,406,737 pounds. This is about 4 per cent of the total landings of the fresh fish, and an increase of 33 per cent compared with the landings during 1929.

Pollock, with landings fresh of 13,976,971 pounds, or about 4 per cent of the total landings of fresh fish in 1930, ranked sixth in importance, and increased 32 per cent over the previous year.

The landings of all other important varieties of fresh fish, amounting to a little over 4 per cent of the total, increased in 1930 over the respective amounts of their landings in 1929 except halibut and swordfish.

Among the salted fish, cod was the most important species, with landings of 2,087,021 pounds. This is 55 per cent of the total landings of all salted fish, and an increase of 86 per cent compared with the landings of this species in 1929.

The landings of salted herring, which usually has been the most important salted fish landed by volume during late years, amounted to 1,563,576 pounds, or 42 per cent of the total. This is a decrease of 56 per cent compared with the landings of this species in 1929.

The landings of salted hake, pollock, cusk, and halibut amounted to 30,837 pounds, and consisted mainly of salted cusk. This amount

FIGURE 14.—Landings of fish by fishing vessels at the principal New England ports, 1930

was 1 per cent of the total landings of salted fish at the three ports. Of this group only the landings of salted hake show a decrease compared with 1929. The landings of salted mackerel amounted to 78,895 pounds, or 2 per cent of the total landings of salted fish. This is a decrease of 64 per cent compared with the landings of this species salted in 1929.

Fishery by months.—During the first six months of the year the landings at the three ports were only slightly more than the landings during the latter six months. As a general rule the landings during the warmer months were larger than during the cooler months of the year. The total landings during the month of July were largest, and amounted to 40,978,410 pounds. Landings during September were second largest with 37,773,835 pounds, and those during April were third largest, amounting to 34,022,632 pounds. The smallest landings were made during December, and they amounted to 16,976,307 pounds. On an average slightly over 29,000,000 pounds were landed monthly.

The following table gives the economic statistics obtained on the landings of fishery products at Boston, Gloucester, and Portland during 1930, for vessels of 5 net tons and upward, as measured by the United States Customs Service. The weights of fresh and salted

fish given in this table represent the weights as landed from the vessels. Many of the fresh fish landed were eviscerated on the vessels. This is true of the ground-fish group, except the flounders. Swordfish are eviscerated and beheaded. Fresh mackerel, flounders, and herring are landed in the round. Species included under "other" are generally landed in the round. Salted ground fish are landed eviscerated and beheaded; salted mackerel eviscerated and split; and salted herring, gibbed. The values are those received by the fisherman. The grades, or sizes given for certain species, are those recognized in the trade.

NOTE.—The weights of fresh and salted fish given in these statistics represent the fish as landed from the vessels, and the values are those received by the fishermen. Large cod are classified as those weighing over 10 pounds; market cod, 2½ to 10 pounds; and scrod cod, 1 to 2½ pounds. Large haddock are those weighing over 2½ pounds and scrod haddock, 1 to 2½ pounds. Large hake are those weighing over 6 pounds and small hake under 6 pounds. Only landings by vessels having a capacity of 5 net tons or greater are used in this tabulation.

NOTE.—Prior to 1916, Portland landings are lacking.

BIOLOGICAL ASPECT

The fishing grounds of the North Atlantic, extending from Flemish Cap in 40° 06' west longitude and 47° north latitude for a distance of about 2,000 miles to New York, provide an almost continuous extent of most productive fishing grounds. Fishing vessels landing fares at Boston and Gloucester, Mass., and Portland, Me., make their catches on certain of these grounds.

In 1930 the fishing fleet landing fares at these three New England ports, and operating on the above-mentioned banks, numbered 441 steam, motor, and sail vessels, of over 5 net tons, as measured by the United States Customs Service. These made 12,494 trips to the fishing grounds, and were absent from port 61,461 days, or on the average about 4.9 days per trip. This is 0.2 of a day longer than the average length of a trip in 1929. Their catches of edible fish landed at the three ports amounted to 353,554,965 pounds when the salted fish had been converted to the basis of fresh gutted or round fish as landed. This does not represent the entire catch of edible fish of these vessels, for small quantities estimated at not more than 5 per cent of their total catch, were landed at ports in New England, other than these three, at New York City, and at ports in New Jersey.

The fishing vessels landing fares at these three ports did not always operate the same type of gear throughout the entire year. At one season a certain vessel may be outfitted as a line trawler; at another season as a purse seiner; and at still another season for swordfish fishing with harpoons. Thus, vessels may be fished with two or more types of gear during the course of a year. In such a case the vessel is classed with others operating similar gear, while it is fishing that type of gear.

From the total it will be noted that the grand total of the number of vessels operated, is exclusive of duplication, and that the total number of vessels operating each type of gear also is shown.

Line trawls.—A line-trawl fishery was prosecuted by 115 vessels in 1930. These vessels made 1,903 trips to 24 main fishing grounds, and were absent from port 11,999 days, or an average of 6.3 days per trip. Their catches aggregated 74,973,078 pounds, or 21 per cent of the total landings by vessels at the three ports. Of this amount, haddock constituted 50 per cent; cod, 32 per cent; and hake, 9 per cent. Other species of importance in the catch by line trawls were cusk, halibut, and pollock. Of the total catch, 32 per cent were taken on Browns Bank, and 32 per cent on South Channel. Other banks on which considerable quantities of fish were taken by line trawls were Georges Bank, La Have Bank, Jeffreys Ledge, Gulf of St. Lawrence, and on miscellaneous banks along the shore.

Hand lines.—A hand-line fishery was prosecuted by 27 vessels in 1930. These vessels made 153 trips to 6 main fishing grounds, and were absent from port, 1,334 days, or an average of 8.7 days per trip. Their catches aggregated 4,968,226 pounds, or slightly over 1 per cent of the total landings at the three ports. Of this amount, cod constituted 83 per cent; haddock, 6 per cent; and pollock, 4 per cent. Only minor amounts of other species were taken by hand lines. Of the total catch, 44 per cent were taken on Georges Bank and 31 per cent on Cape Shore. Other grounds on which considerable quantities of fish were taken by hand lines are Nantucket Shoals and Browns Bank.

Harpoons.—A fishery with harpoons was prosecuted by 91 vessels in 1930. These vessels made 330 trips to 7 main fishing grounds and were absent from port 5,399 days, or an average of 16.4 days per trip. The catch amounted to 3,300,084 pounds of swordfish and 1,750 pounds of other fish, making a total of about 1 per cent of the entire landings by vessels at the three ports in 1930. Of the total catch, 72 per cent was taken on Georges Bank.

Otter trawls, large vessels.—A fishery with otter trawls was prosecuted by 64 vessels of 91 net tons and over in 1930. These vessels made 1,038 trips to 8 main fishing grounds, and were absent from port 10,672 days, or an average of 10.3 days per trip (8.7 days in 1929). This is the same number of vessels that operated in 1929, although they made fewer trips and were absent fewer days than in 1929. Their catch amounted to 87,279,581 pounds, or 25 per cent of the total landings by vessels at the three ports. Of the total 66 per cent consisted of haddock, 19 per cent of cod, 6 per cent of hake, 5 per cent of flounders, and 3 per cent of pollock. The remainder of the catch consisted mainly of halibut. Of the total catch, 74 per cent was taken from Georges Bank and 18 per cent from South Channel. Only minor catches were made on the other grounds where large otter trawlers fished.

Cod, haddock, and hake landed at Boston and Gloucester, Mass., and Portland, Me., by large otter trawlers and large V-D otter trawlers in various years, 1908 to 1930

¹ Data not available.

² Includes 3 Canadian vessels.

Otter trawls, medium vessels.—A fishery with otter trawls was also prosecuted by 73 vessels of 21 to 90 net tons, inclusive, in 1930. Medium otter trawls are referred to by some in the fisheries as “draggers.” These vessels made 727 trips to 9 main fishing grounds and were absent from port 4,652 days, or an average of 6.4 days per trip. Their catches aggregated 20,320,439 pounds, or about 6 per cent of the total landings by vessels at the three ports. Of this, haddock constituted 64 per cent; flounders, 19 per cent; and cod, 14 per cent. Only small quantities of other fish were brought in by this type of vessel. Of the total catch, 45 per cent were taken on Georges Bank, and 39 per cent on South Channel. Only small quantities were taken on the other banks where these vessels fished.

Otter trawls, small vessels.—A fishery with otter trawls was also prosecuted by 69 vessels of 5 to 20 net tons, inclusive, in 1930. Small otter trawlers are referred to by some in the fisheries as “flounder draggers.” These vessels made 547 trips to 7 main fishing grounds, and were absent from port 2,014 days, or an average of 3.7 days per trip. Their catches aggregated 4,834,017 pounds, or a little over 1 per cent of the total landings by vessels at the three ports. Of this amount, 49 per cent consisted of flounders and 33 per cent of haddock. Considerable quantities of cod and hake were also brought in by these vessels. Of the total catch, 57 per cent were taken on banks along the shore, and 22 per cent on South Channel. Catches by this type of vessels on the other banks where they fished were very small.

V-D trawls (otter trawls), large vessels.—A fishery with V-D otter trawls was prosecuted by 51 vessels of 91 net tons and over in 1930. The large number of vessels operating V-D trawls in 1930 is due to the fact that many of the regular otter-trawl vessels also carry a V-D type of trawl and for this reason there is some duplication within the large otter-trawl group and the large V-D trawl group. These vessels made 790 trips to 10 main fishing grounds, and were absent from port 7,206 days, or an average of 9.1 days per trip. Their catches aggregated 58,693,591 pounds, or 17 per cent of the total landings by vessels at the three ports. Of this amount 72 per cent consisted of haddock, 18 per cent of cod, 4 per cent of flounders, 2 per cent of hake, and 2 per cent of pollock. Of the total catch, 57 per cent was taken on Georges Bank and 24 per cent on South Channel.

V-D trawls (otter trawls), medium vessels.—A fishery with V-D otter trawls was prosecuted by 64 vessels of 21 to 90 net tons, inclusive, in 1930. These vessels made 1,101 trips to 10 main fishing grounds, and were absent from port 8,697 days, or an average of 7.9 days per trip. Their catches amounted to 43,902,614 pounds, or about 12 per cent of the total landings by vessels at the three ports. Of this amount, 80 per cent consisted of haddock, 12 per cent of cod, and 4 per cent of flounders. The remainder was made up chiefly of hake and pollock. Of the total catch 56 per cent were taken on Georges Bank and 36 per cent on South Channel. Only minor quantities were taken on the other banks where these vessels fished.

V-D trawls (otter trawls), small vessels.—A fishery with V-D otter trawls was prosecuted by 2 vessels of 5 to 20 net tons, inclusive, in 1930. These vessels made 11 trips to 3 main fishing grounds and were absent from port 89 days, or an average of 8.1 days per trip. Their catch, aggregating 274,899 pounds and consisting almost entirely of haddock, was taken principally on Georges Bank and South Channel.

Sink gill nets.—A fishery with sink gill nets was prosecuted by 39 vessels in 1930. These made 3,614 trips to Jeffreys Ledge and banks along the shore and were absent from port 3,635 days, or an average of about 1 day per trip. The catch amounted to 16,793,933 pounds, or about 5 per cent of the total landings by vessels at the three ports. Of this amount, 53 per cent consisted of pollock, 28 per cent of cod, 10 per cent of haddock, and 8 per cent of hake. Practically the entire amount was taken on those banks along the shore.

Drift gill nets.—A fishery with drift gill nets was prosecuted by 90 vessels in 1930. They made 732 trips to Bay of Islands and banks along the shore and were absent from port 1,520 days, or an average of 2.1 days per trip. Their catch amounted to 3,523,617 pounds, or about 1 per cent of the total landings by vessels at the three ports. Of this amount about two-thirds consisted of herring, which were taken on Bay of Islands, and one-third of mackerel taken mainly on grounds near the shore.

Purse seines.—A fishery with purse seines (mackerel fishery) was prosecuted by 113 vessels in 1930. This is the same number that operated in 1929. They made 1,543 trips to 10 main fishing grounds and were absent from port 4,220 days, or an average of 2.7 days per trip. Their landings at the three New England ports amounted to 34,667,329 pounds or 10 per cent of the total landings at the three ports. Of this amount, 93 per cent consisted of mackerel, and 3 per cent of herring. Of the total, 46 per cent was taken on grounds near the shore and 40 per cent on South Channel. Considerable quantities were also taken off Chatham and on Nantucket Shoals.

Scallop drags or trawls.—A fishery with scallop drags or trawls was prosecuted by 4 vessels in 1930. These made 5 trips to Boston and were absent from port 24 days, or an average of 4.8 days per trip. The catch consisted of 21,807 pounds of scallop meats. These were obtained from scallops taken on Nantucket Shoals, Georges Bank, and South Channel.

Summary.—In general, the otter trawls and V-D trawls were the most important gear used by vessels landing fish at the three New England ports, catching 61 per cent of the total landings. Line trawls were next in importance, catching 21 per cent of the total.

Purse seines were third, with 10 per cent of the total. Sink gill nets accounted for 5 per cent and hand lines, harpoons, drift gill nets, and scallop drags the remaining 3 per cent.

Among the fishing grounds Georges Bank was of most importance, furnishing 42 per cent of the fish caught by the vessels. South Channel, which is near Georges Bank, was second, and furnished 26 per cent. About the same per cent of the total landings was caught on these banks during the year 1929. Shore grounds furnished 12 per cent, Browns Bank, 9 per cent; La Have Bank, 3 per cent; and Nantucket Shoals, 2 per cent. All of these grounds, except La Have Bank, are off the United States. The catch on any one of the other banks or grounds, where fishing was prosecuted by vessels, furnished less than 4,000,000 pounds each.

The fishery products landed at the three ports by vessels are taken chiefly on fishing grounds off the United States west of 66° west longitude. In 1930 these grounds furnished 93 per cent of the total landings by vessels at the three ports. Those fishing grounds off the Canadian Provinces east of 66° west longitude furnished 6 per cent; while those off Newfoundland, also east of 66° west longitude, furnished about 1 per cent.

The large catch on grounds off the United States is influenced by the large catches by otter trawls on Georges Bank, South Channel, Browns Bank, and Nantucket Shoals, which fishing grounds are suited to this type of gear, and which are comparatively near packing centers. Compared with 1929, there was a decrease of 5 per cent in the landings of fish taken on grounds off the United States, an increase of 118 per cent of the landings of the fish taken off Canadian Provinces, and an increase of 53 per cent in the landings of fish taken off Newfoundland.

Landings by fishing vessels at the three principal New England ports, 1930

NOTE.—The three principal New England ports are Boston and Gloucester, Mass., and Portland, Me. Otter trawls and V-D trawls are classified according to the size of the vessel. The weight of salted fish landed has been converted to the equivalent of fresh fish as landed. Only landings by vessels having a capacity of 5 net tons or greater are used in this tabulation.

MACKEREL FISHERY OF THE ATLANTIC COAST

The 1930 mackerel catch totalled 43,156,885 pounds, an amount that has been exceeded only twice in the last 40 years. The season was characterized by good runs of medium and large fish in the southern area off Block Island, and in South Channel up to the end of July. At that time the catch was 42 per cent above that of the previous year. Then the large fish disappeared and small yearlings made up most of the catch during August, September, and October. They were not exceedingly abundant and the catch dropped off severely. In fact, landings during October were almost negligible. The net fishery off Cape Ann in November yielded only moderate quantities.

Statistical summaries appear in the accompanying tables. As heretofore, only the purse seine and drift gill net fisheries have been included. They have been designated as "seiners" and "netters," respectively. Because of their importance in certain seasons, boats under 5 net tons and fishing with purse seines or gill nets have been included insofar as data were available. The catch of shore gear,

FIGURE 15.—Catch of mackerel in the North Atlantic fishery, 1905-1930

such as pound nets and traps, were omitted. Practically all of the statistics were collected by the bureau's agents at Cape May, N. J., New York City, N. Y., Boston, Gloucester, and Woods Hole, Mass., and Portland, Me. A few of the landings, particularly at ports not having a bureau representative, were secured from unofficial sources and often consist of estimated, rather than "weighed-out" fares. The error involved is probably well under 5 per cent in the vessel fishery. The figures on the boat fishery are probably less complete. The catch of bull's-eye mackerel, *Scomber colias*, was not included. It amounted to 450,140 pounds as compared with 54,170 pounds in the previous year.

Southern fishery.—This includes the catch of mackerel in waters off New York, New Jersey, Delaware, Maryland, and Virginia. The area is bounded on the east by longitude 72° W., which passes through the eastern end of Long Island about 9 miles west of Montauk Point.

Most of the vessels participating in this fishery sailed south from Gloucester during the first and second weeks of April. The first catch was made by netters on April 9 and landed at Wildwood, N. J., on April 10.

At this season of the year the seiners operate only on dark nights. The netters may fish on both dark and moonlit nights, but usually

most of their landings are concentrated during the bright-night periods. In 1930 the bright nights were from April 10 to 18 and May 4 to 12, preventing the seiners from fishing at the beginning and the end of the normal southern fishery.

Fifty-one vessels went south for this fishery, 22 fishing regularly from April 19 to May 29. Altogether the seining fleet landed 3,341,362 pounds as compared with 3,233,521 pounds in the previous year.

Netters operated in this area from April 9 to June 6, 40 vessels fishing regularly. Together with 11 other vessels, they caught 3,874,147 pounds as compared with 2,952,938 pounds in 1929. Doubtless the netter catch would have been larger had it not been for bad weather in the early days of the season.

Block Island fishery.—This includes the operations off southern New England between longitude 72° W., and a line drawn 145° from true north from Sankaty Head, Nantucket.

Most of the seining took place in this area between May 19 and June 24 with a few vessels continuing as late as July 9. During this period 53 vessels fished regularly while 24 others participated part of the time. With seining continuing longer than usual, the catch aggregated 8,309,180 pounds as compared with 3,004,270 pounds in 1929.

During the summer, especially the latter part when mackerel were scarce, six more trips totaling 74,820 pounds were landed from this area.

Netters, from May 12 to June 7, with a few continuing to June 25, caught 227,174 pounds in this area as compared with 246,860 in the previous year.

Gulf of Maine.—This region includes all of the waters from Nantucket Shoals to Nova Scotia. Most of the mackerel seining was done in the offing of Cape Cod and in Massachusetts Bay. Some mackerel were caught from Thatchers Island north to Monhegan, Me., but the fishing to the northward was not particularly good.

Most of the seiners shifted their fishing operations from the Block Island region to the Gulf of Maine about June 22, but a few trips were made as early as May 30.

There was an exceptionally good run of large and medium mackerel during the latter part of June and up to the end of July, but thereafter the fishing became poor and most of the landings consisted of small fish.

Due to the dearth of mackerel and unusually bad weather many of the seiners pulled out of the fishery during October, only a few landing trips during the latter half of the month. There were 98 seiners fishing in this region, 65 of them continuing regularly during most of the season. Up to July 31 the catch was ahead of the previous year, but as a result of the decrease which occurred during the late summer the seine catch was 26,137,851 pounds as compared with 35,072,022 in 1929.

During the month of June, nine netters caught 138,290 pounds compared to 165,312 pounds during the equivalent period the previous year.

The fall netting season lasted from about the middle of October to the middle of December with the catch very light during the last several weeks; 75 vessels, of which 52 fished regularly, landed 993,461 pounds as compared with 566,712 the previous year.

Cape Shore fishery.—Due to the exceptionally good fishing in the Block Island region during June, only two seiners made trips to the offing of Nova Scotia in 1930. Their catch, landed June 9 and 10, amounted to 60,600 pounds, as compared with 884,900 pounds landed in 15 trips during the previous year.

Mackerel fishery of the Atlantic coast, 1930

¹ The landings at the ports of Boston, Gloucester, and Portland vary somewhat from those published under "Vessel fisheries at principal New England ports," in the annual reports of the division of fishery industries, due to the inclusion of landings of some small boats in the above data and also to different methods in the collection of the statistics.

² Practically all items in this column up to June 25 were landed at Newport, New Bedford, and Woods Hole; after June 25, at Provincetown.

† Represents the weight of mackerel landed in the round plus the weight of mackerel landed salted which has been converted to the equivalent of fresh mackerel in the round.

FISHERIES OF THE MIDDLE ATLANTIC STATES

During 1929 the value of the catch of fishery products in the Middle Atlantic States (New York, New Jersey, Pennsylvania, and Delaware) exceeded that in any year for which there are records. This was due mainly to the increased production of oysters. These fisheries gave employment to 10,491 fishermen or 5 per cent more than in 1926, the most recent year for which records are available prior to 1929. Of the total number of fishermen employed during 1929, 4,787 regular fishermen were engaged on vessels, and 2,756 regular and 2,948 casual fishermen were employed in the shore and boat fisheries. Their catch amounted to 190,772,611 pounds, valued at \$14,137,608. This is an increase of 14 per cent in the catch and 13 per cent in the value of the catch as compared with the quantity and its value for 1926. Of the total catch in 1929, 120,024,529 pounds, valued at \$3,732,564, were fish; and 70,748,082 pounds, valued at \$10,405,044, were shellfish and miscellaneous products.

Based on the value to the fishermen, oysters with a production of 55,128,765 pounds of meats, valued at \$8,089,886, were the most

FIGURE 16.—Yield of principal fishery products in the Middle Atlantic States, 1929

important product. All varieties of clams were second with 3,420,178 pounds of meats, valued at \$1,140,998. Other products of importance were bay and sea scallops, 2,286,636 pounds of meats, valued at \$528,335; squeteagues or "sea trout," 10,883,804 pounds, valued at \$464,800; flounders, 9,954,150 pounds, valued at \$441,006; lobsters, 1,425,228 pounds, valued at \$376,251; butterfish, 5,619,956 pounds, valued at \$373,959; and bluefish, 3,828,911 pounds, valued at \$354,370. Other products were valued individually at less than \$300,000.

The industries related to the fisheries of the Middle Atlantic States gave employment to 4,846 persons, of whom 284 were engaged in transporting fishery products, 3,747 were in the wholesale trade and received \$5,347,875 in salaries and wages, and 815 were in the manufacturing industry and received \$891,225 in salaries and wages. There were 345 establishments in the wholesale trade handling primary products and 56 were in the manufacturing industry. The latter manufactured products, valued at \$8,174,922, consisting principally of marine-shell products from imported shell, mussel-shell products from fresh-water shell, canned sturgeon caviar, and canned clams.

NEW YORK

The fisheries and industries related to the fisheries of New York in 1929 employed 5,536 persons. This is 4 per cent less than the number employed in these fisheries during 1926, which is the most recent year for which comparable data are available. Of the total number of persons, 3,167 were fishermen, 55 were employed on transporting vessels, 1,984 in the wholesale trade, and 330 in manufacturing industries.

The total catch amounted to 47,259,164 pounds, valued at \$5,061,615. This is a decrease of 22 per cent in quantity and 1 per cent in value, as compared with the catch and its value for 1926. Of the total value of the catch, that of oysters accounted for 45 per cent; clams, 12 per cent; scallops, 10 per cent; and flounders, 5 per cent. Of the total weight of the catch, that of oysters accounted for 21 per cent; flounders, 15 per cent; haddock, 12 per cent; menhaden, 10 per cent; cod, 6 per cent; scallops, 5 per cent; and clams, 4 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in New York during 1929 was taken by 3,167 fishermen, who used 177 motor vessels, 4 sailing vessels, 4 steam vessels, 1,737 motor and other small fishing boats, and 19 major types of gear. The vessels had a combined capacity of 2,961 net tons. The fisheries accounting for the greatest number of persons were the fishery with tongs, employing 589 fishermen, and the scallop dredge fishery, employing 479 fishermen.

CATCH BY GEAR

Five types of gear accounted for 80 per cent of the fishery products taken in the marine fisheries of New York in 1929. Listed in order of their importance, they were: Otter trawls, which accounted for 26 per cent of the total catch; dredges, 24 per cent; lines and purse seines, each 11 per cent; and pound nets, 8 per cent. The catch by otter trawls was principally flounders and haddock; that by dredges, principally oysters and scallops; that by lines, principally tilefish and cod; that by purse seines, principally menhaden; and that by pound nets, principally butterfish, flounders, whiting, squid, scup or porgy, and squeteagues.

OPERATING UNITS BY COUNTIES

Suffolk County was foremost in the number of persons fishing, accounting for 49 per cent of the total. Kings County followed with 16 per cent. Other counties employing a considerable number of fishermen were: Nassau, New York, and Ulster. Suffolk County also led in the number of vessels fishing, accounting for 56 per cent of the total. Kings County followed with 24 per cent. Suffolk County accounted for 64 per cent of the total number of motor and other small fishing boats, and Nassau County followed with 11 per cent.

CATCH BY COUNTIES

Fishing was prosecuted along the coast and in the rivers and bays of 18 counties (exclusive of the Great Lakes) during 1929. Ranked according to value, the fisheries of Suffolk County were most important, accounting for 57 per cent of the catch and 63 per cent of the value of the catch. Kings County was next in importance, accounting for 15 per cent of the catch and 13 per cent of the value. Other counties listed in order of their importance were New York and Nassau.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 55 persons in New York engaged primarily in transporting fishery products by means of vessels. In this trade 19 motor vessels, having a combined capacity of 300 net tons, were operated. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 204 wholesale establishments in New York engaged primarily in handling fresh and frozen products or in handling, but not manufacturing, prepared fishery products. These establishments employed 1,984 persons, who received \$4,107,117 in salaries and wages. New York County alone accounted for 146 of these establishments.

Manufacturing.—There were 27 establishments in New York in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 330 persons, who received \$520,960 in salaries and wages. The products manufactured, consisting principally of smoked fish, were valued at \$5,458,479. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, "Fishery Industries of the United States, 1929."

³ A standard case contains forty-eight 1-pound cans.

⁴ Includes menhaden and fresh-water mussel-shell products, and fish meal from ground fish.

NEW JERSEY

The fisheries and industries related to the fisheries of New Jersey in 1929 employed 7,635 persons. This is 27 per cent more than the number employed in these fisheries during 1926, which is the most recent year for which comparable data are available. Of the total number of persons, 6,009 were fishermen, 222 were employed on transporting vessels and boats, 1,223 in the wholesale trade, and 18 in manufacturing industries.

The total catch amounted to 110,001,064 pounds, valued at \$8,730,624. This is an increase of 50 per cent in quantity and 40 per cent in value, as compared with the catch and its value in 1926. Of the total value of the catch, that of oysters accounted for 66 per cent; clams, 6 per cent; and butterfish, 4 per cent. Of the total weight of the catch, that of oysters accounted for 40 per cent; squeteagues or "sea trout," 8 per cent; scup or porgy, 7 per cent; and menhaden, 6 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in New Jersey during 1929 was taken by 6,009 fishermen, who used 287 motor vessels, 79 sailing vessels, 2,086 motor and other small fishing boats, and 21 major types of gear. The vessels had a combined capacity of 6,442 net tons. The fisheries accounting for the greatest number of persons were the oyster-dredge fishery employing 2,733 fishermen, and the fishery with tongs employing 932 fishermen.

CATCH BY GEAR

Three types of gear accounted for 78 per cent of the fishery products taken in the marine fisheries of New Jersey during 1929. Listed in order of their importance, they were: Dredges, which accounted for 39 per cent of the total catch; pound nets, 28 per cent; and purse seines, 11 per cent. The catch by dredges was principally oysters; that by pound nets, principally whiting, squeteagues, butterfish, king crabs, scup, and menhaden; and that by purse seines was principally scup, menhaden, and squeteagues.

OPERATING UNITS BY COUNTIES

Cumberland County led in the number of persons fishing, accounting for 49 per cent of the total. Cape May County followed, with 16 per cent. Other counties employing a considerable number of fishermen were Ocean, Monmouth, and Atlantic. Cumberland County also was foremost in the number of vessels fishing, accounting for 68 per cent of the total. Cape May County followed with 17 per cent. Cape May County led in the number of motor and other small fishing boats, accounting for 25 per cent of the total, and Atlantic County followed, with 19 per cent.

CATCH BY COUNTIES

Fishing was prosecuted in the marine waters of 14 counties in New Jersey during 1929. Ranked according to value, the fisheries of Cumberland County were most important, accounting for 41 per cent of the total catch and 65 per cent of the total value of the catch. Cape May County followed, with 26 per cent of the catch and 12 per

cent of the value. Other important counties, listed in order of their importance with respect to the value of the catch, were Ocean, Monmouth, and Atlantic.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 38 persons in New Jersey engaged primarily in transporting fishery products by means of vessels. In this trade 11 motor vessels having a combined capacity of 197 net tons were operated. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 82 wholesale establishments in New Jersey engaged primarily in handling fresh and frozen products. These establishments employed 1,223 persons who received \$536,058 in salaries and wages. Cumberland County alone accounted for 38 of these establishments.

Manufacturing.—There were 15 establishments in New Jersey in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 181 persons who received \$127,943 in salaries and wages. The products manufactured, consisting of smoked fish, canned clam chowder, oyster-shell products, and menhaden and king crab products, were valued at \$1,126,467. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

PENNSYLVANIA

The fisheries and industries related to the fisheries of Pennsylvania in 1929 employed 530 persons. This is 18 per cent less than the number employed in these fisheries during 1926, which is the most recent year for which comparable data are available. Of the total number of persons, 53 were fishermen, 356 were engaged in the wholesale trade, and 121 in manufacturing industries.

The total catch amounted to 41,904 pounds, valued at \$9,388. This is a decrease of 94 per cent in quantity and 79 per cent in value, as compared with the catch and its value in 1926. Of the total catch, that of shad accounted for 52 per cent of the weight and 79 per cent of the value.

OPERATING UNITS BY GEAR

The catch of fishery products in Pennsylvania during 1929 was taken by 53 fishermen, who used 20 motor and other small fishing boats and 5 major types of gear. The haul-seine fishery accounted for 37 of these fishermen, and 11 of the small fishing boats.

CATCH BY GEAR

Two types of gear accounted for 92 per cent of the fishery products taken in the fisheries of Pennsylvania during 1929. Haul seines were the most important, accounting for 76 per cent of the total catch, and drift gill nets followed with 16 per cent. The catch by both haul seines and drift gill nets was principally shad.

OPERATING UNITS BY COUNTIES

Bucks County was foremost in the number of persons fishing, accounting for 74 per cent of the total. Delaware County followed with 17 per cent. Bucks County also accounted for 60 per cent of the motor and other small boats.

CATCH BY COUNTIES

Fishing was prosecuted in the waters of three counties in Pennsylvania during 1929. The fisheries of Bucks County were most important, accounting for 77 per cent of the total catch and 85 per cent of the total value of the catch. Delaware County followed with 14 per cent of the quantity and 9 per cent of the value.

INDUSTRIES RELATED TO THE FISHERIES

Wholesale.—There were 44 establishments in Pennsylvania in 1929 engaged primarily in handling fresh and frozen products. These establishments employed 356 persons, who received \$668,750 in salaries and wages. All of these establishments were located in Philadelphia.

Manufacturing.—There were nine establishments in Pennsylvania in 1929 engaged primarily in the manufacture of fishery products and by-products. They employed 121 persons, who received \$188,772 in salaries and wages. The products manufactured, consisting principally of smoked fish and oyster-shell products, were valued at \$1,171,135.

DELAWARE

The fisheries and industries related to the fisheries of Delaware in 1929 employed 1,636 persons. This is 15 per cent less than the number employed in these fisheries during 1926, which is the most recent year for which comparable data are available. Of the total number of persons, 1,262 were fishermen, 7 were employed on transporting vessels, 184 in the wholesale trade, and 183 in manufacturing industries.

The total catch amounted to 33,470,479 pounds, valued at \$335,981. This is an increase of 1 per cent in the catch but a decrease of 67 per cent in the value of the catch, as compared with the catch and its value in 1926. Of the total value of the catch, that of menhaden accounted for 33 per cent; oysters, 20 per cent; and squeteagues or "sea trout," 12 per cent. Of the total weight of the catch, that of menhaden accounted for 88 per cent, and oysters and squeteagues or "sea trout," each 3 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products along the coast of Delaware during 1929 was taken by 1,262 fishermen, who used 15 steam vessels, 15 motor vessels, 2 sailing vessels, 326 motor and other small fishing boats, and 15 major types of gear. The vessels had a combined capacity of 2,296 net tons. The fisheries accounting for the greatest number of persons were the purse-seine fishery employing 551 fishermen and the haul-seine fishery employing 322 fishermen.

CATCH BY GEAR

The catch of fishery products by purse seines in Delaware during 1929 accounted for 88 per cent of the total. The entire catch by purse seines was menhaden.

OPERATING UNITS BY COUNTIES

Of the three counties of Delaware, Sussex County accounted for 71 per cent of the total number of fishermen, 56 per cent of the total number of vessels, and 52 per cent of the motor and other small fishing boats. Kent County was next in importance, accounting for 21 per cent of the fishermen, 44 per cent of the fishing vessels, and 29 per cent of the small fishing boats.

CATCH BY COUNTIES

Fishing was prosecuted in the marine waters of three counties in Delaware during 1929. Ranked according to value, the fisheries of Sussex County were the most important, accounting for 93 per cent of the total catch, and 62 per cent of the total value of the catch. Kent was next in importance, accounting for 6 per cent of the quantity and 30 per cent of the value.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were seven persons in Delaware engaged primarily in transporting fishery products by means of vessels. In this trade two motor vessels, having a combined capacity of 14 net tons, were operated. Both of these vessels were between the capacity ranges of 5 and 10 net tons.

Wholesale.—There were 15 establishments in Delaware engaged primarily in handling fresh and frozen products. These establishments employed 184 persons, who received \$35,950 in salaries and wages.

Manufacturing.—There were five establishments in Delaware in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 183 persons, who received \$53,550 in salaries and wages. The products manufactured, consisting of sturgeon caviar, menhaden products, and king crab scrap, were valued at \$418,841. Detailed statistics of most of the production of by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

HISTORICAL REVIEW

Thirteen general surveys have been made for statistics of the fisheries of the Middle Atlantic States during the 50 years from 1880 to 1929. The catch for 1880 amounted to 408,202,000 pounds, the largest on record. Since that time the catch has continued to decrease with the second smallest catch on record shown for 1929 when 190,773,00 pounds were taken. Comparative statistics for each of the more important species taken are shown in the following tables:

Fisheries of the Middle Atlantic States, 1880 to 1929

¹ Value \$187,500.² Data not available.³ Includes hard and soft clams.⁴ From 1880 to 1908, inclusive, oysters taken from Delaware and New Jersey beds by vessels owned in Pennsylvania, were credited to the latter State, but since 1908 they have been credited to the States in which the beds are located.VESSEL FISHERIES AT NEW YORK CITY AND GROTON, CONN.¹

During 1930 fishing vessels of 5 net tons capacity and over landed 57,255,000 pounds of fishery products at New York City and Groton, Conn. This is 24 per cent less than the landings at these ports in 1929 and also is less than the landings in 1928. However, the landings of 1930 were considerably greater than for any other year since 1921. There were decreases in practically every species of importance landed at these ports. The landings of haddock amounted to 36,540,000 pounds, accounting for 64 per cent of the total; those of flounders amounted to 6,951,000 pounds, or 12 per cent of the total; cod, 3,981,000 pounds, or 7 per cent of the total; mackerel, 3,602,000 pounds, or 6 per cent of the total; and tilefish, 2,907,000 pounds, or 5 per cent of the total. The total landings of all other species amounted to about 6 per cent of the total. The only important species which showed an increase in landings over 1929 were mackerel and tilefish.

¹ Statistics of the landings of fish by vessels of 5 net tons and over at New York City have been collected during the past few years by J. H. Matthews, executive secretary, United States Fisheries Association. These have been forwarded to the bureau, where they have been compiled. Since November, 1927, statistics of the landings of fish by vessels at Groton, Conn., have been included with those for fish landed at New York City, because at that time one of the firms packing fish at New York City moved its plant to Groton, thus requiring its trawlers to unload at Groton. By including the landings at Groton, the figures since November, 1927, are comparable with those for previous years. The statistics at both ports are combined to avoid disclosing individual enterprise.

Landings of fish at New York City and Groton, Conn., 1922 to 1930¹

² Includes the landings of some mixed fish.

³ Where landings are not shown for certain species, it is probable that they are included under "Miscellaneous."

FIGURE 17.—Catch of shad in the Hudson and Potomac Rivers for various years, 1896 to 1930

SHAD FISHERY OF THE HUDSON RIVER

Shad fishing on the Hudson River in 1930 was followed by 243 fishermen who used 21 motor boats, 109 other boats, 105 drift gill nets that had a total area of 324,681 square yards, and 21 stake gill nets that had an area of 33,030 square yards. The catch amounted

to 61,441 shad, having a weight of 206,504 pounds, and a value to the fishermen of \$33,372. This is an increase of 9 per cent in both number of shad and their value as compared with the production in 1929. The price per pound received by the fishermen in 1930 varied but little from that obtained during the previous year.

The catch of shad taken by drift gill nets accounted for 72 per cent of the total and that by stake gill nets accounted for 27 per cent. Approximately 1 per cent of the catch was made by gear which was fished primarily for other species.

With the exception of some fishing with stake gill nets from one town in New Jersey, the fishing was prosecuted from points in New York.

¹ Includes catch in lower New York Bay, Raritan Bay, and tributaries, but this was inconsiderable.

FISHERIES OF THE CHESAPEAKE BAY STATES

In the years for which there are records the value of the catch of fishery products in the Chesapeake Bay States (Maryland and Virginia) during 1929 was exceeded only in 1920 and 1925. These fish-

eries gave employment to 18,470 fishermen or 26 per cent less than in 1925, the most recent year for which records are available prior to 1929. Of the total number of fishermen employed during 1929, 2,586 regular fishermen were engaged on vessels, and 7,063 regular and 8,821 casual fishermen were employed in the shore and boat fisheries. Their catch amounted to 274,673,437 pounds, valued at \$11,580,628. This is a decrease of 18 per cent in the catch and 17 per cent in the value of the catch as compared with the quantity and its value for 1925. Of the total catch in 1929, 169,064,502 pounds, valued at \$4,633,493, were fish; and 105,608,935 pounds, valued at \$6,947,135, were shellfish and miscellaneous products.

Based on the value to the fishermen, oysters with a production of 43,113,598 pounds of meats, valued at \$4,890,786, were the most important product. Shad were second with a production of 9,525,686 pounds, valued at \$1,602,105. Other products of importance were: Blue crabs, 60,177,504 pounds, valued at \$1,467,898; menhaden,

FIGURE 18.—Yield of principal fishery products in the Chesapeake Bay States, 1929

99,229,250 pounds, valued at \$823,020; squeteagues or "sea trout," 11,388,751 pounds, valued at \$487,096; croaker, 16,620,836 pounds, valued at \$413,199; butterfish, 6,443,502 pounds, valued at \$383,218; and hard clams, 986,491 pounds of meats, valued at \$374,160. Other products were valued individually at less than \$300,000.

The industries related to the fisheries of the Chesapeake Bay States gave employment to 8,868 persons; of whom 855 were engaged in transporting fishery products, 6,498 were in the wholesale trade and received \$2,727,048 in salaries and wages, 1,459 were in the manufacturing industry and received \$599,327 in salaries and wages, and 56 were fishermen who prepared fishery products and are duplicated in the total number of fishermen employed as shown above. There were 450 establishments in the wholesale trade handling primary products and 58 establishments in the manufacturing industry. The latter manufactured products, valued at \$2,887,647, consisting principally of menhaden products, oyster-shell products, and canned alewife products. In addition, the fishermen prepared fishery products valued at \$13,624. Most of these products were salt fish prepared from alewives and eels.

MARYLAND

The fisheries and industries related to the fisheries of Maryland in 1929 employed 12,962 fishermen, which is a decrease of 34 per cent, as compared with the number employed in 1925—the most recent year for which comparable data are available. Of the total number of persons, 8,429 were fishermen, 423 were employed on transporting vessels, 3,580 in the wholesale trade, and 530 in manufacturing industries. Of the fishermen, 53 also were engaged in the manufacture of prepared fishery products.

The total catch amounted to 63,387,608 pounds, valued at \$4,294,959, which is an increase of 11 per cent in the catch but a decrease of 12 per cent in the value of the catch, as compared with the catch and its value in 1925. Of the total value of the catch, that of oysters accounted for 57 per cent; crabs, 19 per cent; and striped bass and shad, each, 5 per cent. Of the total weight of the catch, that of crabs accounted for 44 per cent; oysters, 28 per cent; alewives, 9 per cent; and squeteagues or "sea trout," 5 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Maryland during 1929 was taken by 8,429 fishermen who used 3 motor vessels, 264 sailing vessels, 5,758 motor and other small fishing boats, and 16 major types of gear. The vessels had a combined capacity of 2,870 net tons. The fisheries accounting for the greatest number of persons were the tong fishery employing 4,438 fisherman and the dredge fishery employing 1,366 fishermen.

CATCH BY GEAR

Four types of gear accounted for 87 per cent of the fishery products taken in the fisheries of Maryland during 1929. Listed in order of their importance they were: Lines, which accounted for 38 per cent

of the catch; tongs, 22 per cent; pound nets, 20 per cent; and oyster dredges, 7 per cent. The catch by lines was principally hard crabs; that by tongs, almost exclusively oysters; that by pound nets, chiefly alewives, squeteagues, and croaker; and that by oyster dredges, exclusively oysters.

OPERATING UNITS BY COUNTIES

Somerset County was foremost in the number of persons fishing, accounting for 19 per cent of the total. Dorchester County followed with 17 per cent. Other counties employing a considerable number of fishermen were Talbot, St. Marys, Anne Arundel, and Queen Annes. Somerset County accounted for 41 per cent of the total number of fishing vessels, and Dorchester County accounted for 37 per cent. Somerset County also led in the number of motor and other small fishing boats, accounting for 25 per cent of the total. Dorchester County followed with 14 per cent.

CATCH BY COUNTIES

Fishing was prosecuted along the coast and in the coastal rivers and bays of 16 counties of Maryland during 1929. Ranked according to value, the fisheries of Dorchester County were most important, accounting for 26 per cent of the total catch and 19 per cent of the total value of the catch. Somerset was next in importance, accounting for 13 per cent of the quantity and 18 per cent of the value. Other important producing counties listed in order of their importance with respect to the value of this catch were Talbot, Queen Annes, Worcester, Kent, and Anne Arundel.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 423 persons in Maryland engaged primarily in transporting fishery products by means of vessels. In this trade 187 motor vessels and 43 sailing vessels, having a combined capacity of 4,182 net tons, were operated. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 298 wholesale establishments in Maryland engaged primarily in handling fresh and frozen products. These establishments employed 3,580 persons, who received \$1,593,468 in salaries and wages. Somerset County alone accounted for 132 of these establishments.

Manufacturing.—There were 17 establishments in Maryland in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 530 persons who received \$164,416 in salaries and wages. The products manufactured, consisting principally of salted and smoked fish, canned oysters, canned alewife products and oyster-shell products, were valued at \$1,027,529. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

Fishermen's prepared products.—In addition to the output of prepared products by manufacturing firms, there were 53 fishermen in Maryland preparing fishery products. Their output, consisting principally of salted alewives and salted eels, amounted to 238,040 pounds valued at \$13,124.

¹ Includes products prepared by 11 firms whose activities were principally in the wholesale fishery trade.

² A standard case contains forty-eight 5-ounce cans of oysters and forty-eight 1-pound cans of alewives and alewife roe.

³ Includes crab scrap, alewife scrap, and alewife oil.

VIRGINIA

The fisheries and industries related to the fisheries of Virginia in 1929 employed 14,320 persons, which is a decrease of 26 per cent, as compared with the number employed in 1925—the most recent year for which comparable data are available. Of the total number of persons, 10,041 were fishermen, 432 were employed on transporting vessels, 2,918 in the wholesale trade, and 929 in the manufacturing industries. Of the fishermen, three also were engaged in the manufacture of prepared fishery products.

The total catch amounted to 211,285,829 pounds, valued at \$7,285,669, which is a decrease of 24 per cent in the catch and 20 per cent in the value of the catch, as compared with the catch and its value in 1925. Of the total value of the catch, that of oysters

accounted for 33 per cent; shad, 19 per cent; menhaden, 11 per cent; crabs, 9 per cent; and croakers, squeteagues, and clams, each 5 per cent. Of the total weight of the catch, that of menhaden accounted for 47 per cent; crabs, 15 per cent; oysters, 12 per cent; croakers, 7 per cent; and alewives, 6 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Virginia during 1929 was taken by 10,041 fishermen, who used 30 steam vessels, 92 motor vessels, 17 sailing vessels, 7,639 motor and other small fishing boats, and 14 major types of gear. The vessels had a combined capacity of 4,469 net tons. The fisheries accounting for the greatest number of persons were the fishery with tongs employing 4,250 fishermen, the pound-net fishery employing 2,139 fishermen, the trot-line fishery employing 1,054 fishermen, and the purse-seine fishery employing 1039 fishermen.

CATCH BY GEAR

Five types of gear accounted for 96 per cent of the fishery products taken in the fisheries of Virginia during 1929. Listed in order of their importance they were: Purse seines, which accounted for 47 per cent of the catch; pound nets, 23 per cent; lines and tongs, each, 10 per cent; and dredges, 6 per cent. The catch by purse seines was exclusively menhaden; that by pound nets was chiefly alewives, croaker, squeteagues or "sea trout," and shad; that by lines almost exclusively crabs; that by tongs principally oysters; and that by dredges consisted of crabs, oysters, and scallops.

OPERATING UNITS BY COUNTIES

Accomac County was foremost in the number of persons fishing, accounting for 17 per cent of the total. Northumberland County followed, accounting for 14 per cent. Other counties employing a considerable number of fishermen were Lancaster, Middlesex, Northampton, Mathews, York, and Gloucester. York County accounted for 29 per cent of the total number of fishing vessels, Northumberland County accounted for 19 per cent, and Elizabeth City County, 17 per cent. Accomac County led in the number of motor and other small fishing boats, accounting for 21 per cent of the total. Northampton followed with 13 per cent.

CATCH BY COUNTIES

Fishing was prosecuted along the coast and in the coastal rivers and bays of 31 counties in Virginia during 1929. Ranked according to value, the fisheries of Accomac County were most important, accounting for 14 per cent of the total catch and 19 per cent of the total value of the catch. Northumberland County was next in the value of the catch, accounting for 38 per cent of the quantity and 14 per cent of the value. Other important counties listed in order of their importance with respect to the value of the catch were Mathews and Lancaster.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 432 persons in Virginia engaged primarily in transporting fishery products by means of vessels. In this trade, 2 steam vessels, 231 motor vessels, and 2 sailing vessels, having a combined capacity of 2,816 net tons, were operated. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 152 wholesale establishments in Virginia engaged primarily in handling fresh and frozen products. These establishments employed 2,918 persons, who received \$1,133,580 in salaries and wages. Accomac County accounted for 68 of these establishments.

Manufacturing.—There were 41 establishments in Virginia in 1929 engaged primarily in the manufacture of fishery products and by-products. They employed 929 persons, who received \$434,911 in salaries and wages. The products manufactured, consisting principally of menhaden and oyster-shell products, and canned and salted alewife products, were valued at \$1,803,596. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

Fishermen's prepared products.—In addition to the output of prepared products by manufacturing firms, there were three fishermen in Virginia preparing fishery products. Their output, consisting entirely of sturgeon roe, amounted to 500 pounds, valued at \$500.

³ Includes canned crab meat and alewife scales.

HISTORICAL REVIEW

Twelve general surveys have been made for statistics of the Chesapeake Bay States during the 50-year period from 1880 to 1929. The catch for 1929, amounting to 274,673,000 pounds, was considerably less than that in any year since 1888. The largest catch was made in 1920, when 530,750,000 pounds were taken. Comparative statistics for the catch of each of the more important species are shown in the following tables.

Fisheries of the Chesapeake Bay States, 1880 to 1929

SHAD AND ALEWIFE FISHERIES OF THE POTOMAC RIVER

The shad and alewife fisheries of the Potomac River were prosecuted by 608 fishermen in 1930 or 21 per cent less than in 1929. These fishermen used 440 motor and other small boats, 405 pound nets, 698 gill nets having a combined area of 343,902 square yards, and 1 haul seine having a length of 100 yards.

The catch of shad amounted to 175,150 in number, with a weight of 601,193 pounds, valued at \$98,041 to the fishermen. This is a decrease of 43 per cent in the weight of the catch as compared with that for the previous year, and is less in weight than the catch for any year for which there are records since 1896, except 1924. The average price per pound as received by the fishermen increased from 13.5 cents per pound in 1929 to 16.3 cents per pound in 1930. More than nine-tenths of the catch was made by Virginia fishermen and was taken largely by pound nets in Northumberland County. The catch by Maryland fishermen was taken chiefly by gill nets in Charles County and by pound nets in St. Marys County.

The catch of roe shad amounted to 47 per cent of the total number of shad taken. In 1929 the catch of roe shad amounted to 54 per cent of the total number.

The collection of shad eggs at the bureau's hatchery at Fort Humphreys amounted to less than 3,000,000 eggs in 1930, while during 1929, this station hatched 65,851,000 shad. The unsuccessful egg collecting operations are attributed to the light run of shad brought about by drought and low-water conditions, which caused greater saline conditions farther up into the spawning grounds.

The catch of alewives amounted to 7,785,500 in number, with a weight of 3,114,918 pounds, valued at \$49,315. This is an increase of 1 per cent in the weight of the catch as compared with that for 1929, but is smaller than any other catch on record since that for 1915. The amount of the catch in 1915 was but little less than that made in 1930. The average price per pound as received by the fishermen decreased from 1.8 cents per pound in 1929 to 1.6 cents per pound in 1930. Nearly nine-tenths of the catch was made by Virginia fishermen, largely in Northumberland County. The catch by Maryland fishermen was made chiefly in St. Marys County. By far the larger part of the catch in both States was taken by pound nets.

NOTE.—The number of shad taken in the Potomac River in 1878 was 186,000; in 1880, 552,872; in 1889, 868,900; in 1890, 731,453; and in 1891, 621,977.

TRADE IN FRESH, FROZEN, AND SMOKED FISHERY PRODUCTS IN WASHINGTON, D. C.

The municipal fish wharf and market in Washington, D. C., was built about 14 years ago in the southwestern part of the city on an arm of the Potomac River. At the present time 18 fishery firms have stalls in this market. In addition four are located across the street from the market, and six elsewhere in the city. About one-half of the firms sell at wholesale exclusively, although each of the remaining establishments engages more or less in wholesaling fish in addition to selling at retail. Altogether the 28 above firms employed 136 persons, who received \$181,787 in salaries and wages. Of the total employees, 78 were regularly employed by those firms at the municipal fish wharf.

The municipal fish market is so situated that fishing boats may land their fish directly, although only about 10 per cent of the fish are received in this way. The greater part are received by truck from New Jersey, North Carolina, Maryland, and Virginia, the bulk of these arrivals coming from the latter two States. Fish arriving from the Atlantic coast, Gulf, Pacific coast, or the Great Lakes States by rail are transported by truck from the rail terminals to the markets, as they have no direct rail connections.

Some of the fish from the vessels, boats, and trucks are sold at auction direct to the dealers. Several of the wholesalers also sell fish by auction to retail merchants and hucksters. However, the greater part of the business in the market, of both buying and selling, is transacted at a set price.

During 1930 the receipts of fresh and frozen fishery products at the municipal wharf amounted to 8,926,026 pounds. This is a decrease of a little more than 3 per cent as compared with the receipts during 1929. However, it is an increase of approximately 12 per cent compared with the average receipts during the past five years. It is estimated that 3,000,000 pounds of fresh and frozen fishery products entered the District of Columbia direct from outside sources through hotels, restaurants, fish markets, and grocery stores. This, added to the amount received at the municipal fish wharf, would make a

total of nearly 12,000,000 pounds of fresh and frozen fishery products handled in the District of Columbia by all dealers during 1930. Virtually the entire amount was consumed in the district. However, a few hucksters from towns in Virginia and Maryland, bringing poultry and other products to market, buy fish here and sell them on their return trip. Some of these hucksters go as far as Pennsylvania and West Virginia towns.

There has been very little change in the kind of fish handled in the municipal market in the past 10 years. Taking those species which constituted 75 per cent of the trade for the various years from 1921 to 1930, squeteagues or "sea trout" are the most important each year. Croaker has usually been second, river herring third, and oysters fourth. In 1930 the first three species mentioned held their places, and crabs and crab meat moved up to fourth place, with haddock fifth, oysters sixth, and shad seventh.

The trade at municipal fish wharf is most active during the months from March to November, the largest quantities being handled during the months of April and May. The unusual activity during these latter months can be accounted for chiefly by the large amount of river herring, croaker, and shad, which are handled during these two months.

There is one public cold-storage warehouse in Washington which makes a practice of storing frozen fishery products. This is located directly across the street from the municipal fish market, and stores considerable quantities of the frozen fish sold through the market. This warehouse has direct rail connection with the main lines of the railroads.

During 1930 three firms in Washington, D. C., smoked fishery products. Their production amounted to 486,500 pounds, valued at \$48,410. Of this amount 454,000 pounds, valued at \$39,240, consisted of herring, and 32,500 pounds, valued at \$9,170, of whitefish. Most of these products were marketed in the city.

The retail fish business in the District of Columbia is carried on by stores in the municipal market, retail fish markets, uptown grocery stores, meat markets, and fish peddlers. There are about 40 fish peddlers in the city who devote their entire time to selling fish, about 25 with horse and wagon and 15 with automobile trucks. This number greatly increases during April and May, when the season for shad, croaker, and river herring is at its highest. The number of fish peddlers slightly increased during the year 1930, which was due possibly to lack of employment in other lines. A large number of markets and grocery stores selling fish at retail now dress them for their customers and also sell large quantities of packaged fish. This has a tendency to decrease the number of fish peddlers since these latter do not make a practice of dressing the fish they market.

The population of the District of Columbia on April 1, 1930, according to figures collected by the United States Bureau of the Census, was 486,869. The total consumption of fresh and frozen fishery products, in round weight, and smoked fishery products, as prepared, is estimated to be about 12,000,000 pounds in the city, making the per capita consumption of these products about 24 pounds annually.

FISHERIES OF THE SOUTH ATLANTIC AND GULF STATES

In the years for which there are records, the value of the catch of fishery products in the South Atlantic and Gulf States (North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas) during 1929 was exceeded only in 1927 and 1928. These fisheries gave employment to 26,643 fishermen or 7 per cent less than in 1928. Of the total number of fishermen employed during 1929, 3,298 regular fishermen were engaged on vessels, and 17,235 regular and 6,110 casual fishermen were employed in the shore and boat fisheries. Their catch amounted to 535,395,859 pounds, valued at \$14,903,945. This is an increase of 18 per cent in the catch and a decrease of 7 per cent in the value of the catch as compared with the

catch and its value for 1928. Of the total catch in 1929, 375,962,766 pounds, valued at \$7,401,812, were fish, and 159,432,093 pounds, valued at \$7,502,133, were shellfish and miscellaneous products.

Based on the value to the fishermen, shrimp with a production of 108,550,538 pounds, valued at \$4,435,366, was the most important product. Oysters were second with a production of 41,805,187 pounds of meats, valued at \$1,691,257. Other products of importance were mullet, 33,660,810 pounds, valued at \$1,328,065; menhaden, 253,234,620 pounds, valued at \$1,143,706; sponges of all varieties, 528,721 pounds, valued at \$879,646; squeteagues or "sea trout," 11,330,377 pounds, valued at \$875,355; red and mangrove snapper, 10,236,214 pounds, valued at \$830,809; and shad, 3,346,409

FIGURE 19.—Yield of principal fishery products in the South Atlantic and Gulf States, 1929

pounds, valued at \$619,605. Other products were valued individually at less than \$400,000.

The industries related to the fisheries of the South Atlantic and Gulf States gave employment to 9,816 persons, of whom 757 were engaged in transporting fishery products, 3,394 were in the wholesale trade and received \$1,835,556 in salaries and wages, 4,908 were in the manufacturing industry and received \$2,319,890 in salaries and wages, and 757 were fishermen who prepared fishery products and are duplicated in the total number of fishermen employed as shown above. Of the persons in transporting craft, 308 also have been included as fishermen. There were 498 establishments in the wholesale trade handling primary products, and 174 establishments were in the manufacturing industry. The latter manufactured products valued at \$13,341,563, consisting principally of canned shrimp and oysters, and oyster shell and menhaden products. In addition, the fishermen prepared fishery products valued at \$107,871. Most of these products were salt fish prepared from mullet and alewives.

Fisheries of the South Atlantic and Gulf States, 1929

NORTH CAROLINA

The fisheries and industries related to the fisheries of North Carolina in 1929 employed 6,792 persons, which is less than one-half of 1 per cent less than the number employed in 1928. Of the total number of persons, 5,975 were fishermen, 85 were employed on transporting vessels and boats, 358 in the wholesale trade, and 382 in manufacturing industries. Of the number employed on transporting vessels and boats, 8 represent a duplication of those persons shown as fishermen. There also were 361 fishermen engaged in the manu-

ufacture of prepared fishery products. These have already been included as fishermen.

The total catch amounted to 217,595,293 pounds valued at \$2,544,007, which is an increase of 53 per cent in the catch but a decrease of 3 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, that of menhaden accounted for 28 per cent; shad, 14 per cent; and squeteagues and oysters, each 10 per cent. Of the total weight of the catch, that of menhaden accounted for 80 per cent; alewives, 5 per cent; and croakers, 4 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in North Carolina during 1929 was taken by 5,975 fishermen, who used 80 motor vessels, 64 sailing vessels, 3,746 motor and other small fishing boats, and 16 major types of gear. The vessels had a combined capacity of 2,450 net tons. The fisheries accounting for the greatest number of persons were the fishery with rakes employing 1,071 fishermen and that with common haul seines employing 1,807 fishermen.

CATCH BY GEAR

Four types of gear accounted for 97 per cent of the fishery products taken in the fisheries of North Carolina during 1929. Listed in order of their importance they were: Purse seines, which accounted for 80 per cent of the catch; pound nets, 7 per cent; haul seines, 6 per cent; and gill nets, 4 per cent. The catch by purse seines consisted almost exclusively of menhaden; that by pound nets principally alewives, croakers and shad; that by haul seines chiefly croaker, spot, alewives, squeteagues, and mullet; and that by gill nets principally croaker, squeteagues, and mullet.

OPERATING UNITS BY COUNTIES

Carteret County was foremost in the number of persons fishing, accounting for 37 per cent of the total. Dare County followed with 10 per cent. Other counties employing a considerable number of fishermen were Brunswick, Onslow, Pender, and Currituck. Carteret County also ranked first in the number of vessels, and motor and other small fishing boats operated, accounting for 55 per cent of the total number of fishing vessels and 35 per cent of the motor and other small fishing boats. Beaufort County and Pamlico County each accounted for 15 per cent of the total number of vessels, and Dare County accounted for 13 per cent of the small fishing boats.

CATCH BY COUNTIES

Fishing was prosecuted along the coast and in the coastal rivers and bays of 23 counties of North Carolina during 1929. Ranked according to value, the fisheries of Carteret County were most important, accounting for 70 per cent of the total catch and 45 per cent of the total value of the catch. Dare County was next in the value of the catch, accounting for 3 per cent of the quantity and 18 per cent of the value. Other important producing counties listed in order of their importance with respect to the value of the catch were Brunswick, Pamlico, Currituck, and Beaufort.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 85 persons in North Carolina engaged primarily in transporting fishery products by means of vessels and boats. In this trade 33 motor vessels and 35 under-tonnage boats were operated. The vessels had a combined capacity of 349 net tons. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 68 wholesale establishments in North Carolina engaged primarily in handling fresh and frozen products. These establishments employed 358 persons, who received \$164,367 in salaries and wages. Carteret County alone accounted for 30 of these establishments.

Manufacturing.—There were 22 establishments in North Carolina in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 382 persons, who received \$207,599 in salaries and wages. The products manufactured, consisting principally of menhaden products, were valued at \$1,165,537. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

Fishermen's prepared products.—In addition to the output of prepared products by manufacturing firms, there were 361 fishermen in North Carolina preparing fishery products. Their output, consisting principally of salted alewives and mullet, amounted to 3,329,082 pounds, valued at \$64,998.

³ Includes spiced alewives, canned shrimp, canned alewife roe, and oyster-shell products.

SOUTH CAROLINA

The fisheries and industries related to the fisheries of South Carolina in 1929 employed 2,384 fishermen, which is 6 per cent less than the number employed during 1928. Of the total number of persons, 1,571 were fishermen, 124 were engaged on transporting vessels and boats, 219 in the wholesale trade, and 470 in manufacturing industries. Of the fishermen, 264 were engaged also in the manufacture of prepared fishery products.

The total catch amounted to 6,135,133 pounds, valued at \$275,118, which is a decrease of 17 per cent in the catch and 13 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, that of oysters accounted for 46 per cent; shad, 20 per cent; mullet and sea bass, each, 8 per cent; shrimp, 6 per cent; and king whiting or "kingfish," 4 per cent. Of the total weight of the catch, that of oysters accounted for 75 per cent; mullet and shrimp, each 5 per cent; and sea bass and shad, each 4 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in South Carolina during 1929 was taken by 1,571 fishermen, who used 10 motor vessels, 1,042 motor and other small fishing boats, and 10 major types of gear. The vessels had a combined capacity of 112 net tons. The fisheries accounting for the greatest number of persons were the fishery with grabs employing 555 fishermen, the haul-seine fishery employing 315 fishermen, and the drift gill-net fishery employing 277 fishermen.

CATCH BY GEAR

Four types of gear accounted for 90 per cent of the fishery products taken in the fisheries of South Carolina during 1929. Listed in order of their importance they were: Grabs which accounted for 71 per cent of the catch; lines, 8 per cent; gill nets, 6 per cent; and haul seines, 5 per cent. The catch by grabs was exclusively oysters; that by lines consisted principally of sea bass and king whiting or "kingfish"; that by gill nets chiefly shad; and that by haul seines largely mullet.

OPERATING UNITS BY COUNTIES

Beaufort and Charleston Counties each accounted for 27 per cent of the total number of persons fishing. Other counties employing a considerable number of fishermen were Georgetown and Horry Counties. Ten fishing vessels were operated in the State, all of which were operated in Charleston County. Beaufort County led in the number of motor and other small fishing boats, accounting for 39 per cent of the total. Charleston County followed with 28 per cent.

CATCH BY COUNTIES

Fishing was prosecuted in the marine waters of eight counties of South Carolina during 1929. Ranked according to value, the fisheries of Charleston County were most important, accounting for 42 per cent of the total catch and 43 per cent of the total value of the catch. Beaufort County was next in importance, accounting for 46 per cent of the catch and 30 per cent of the value. Other important producing counties listed in order of their importance with respect to value were Georgetown, Horry, and Colleton.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 124 persons in South Carolina engaged primarily in transporting fishery products by means of vessels and boats. In this trade 10 motor vessels, 40 sailing vessels, and 16 undertonnage boats were operated. The vessels had a combined capacity of 494 net tons. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 22 wholesale establishments in South Carolina engaged primarily in handling fresh and frozen products. These establishments employed 219 persons, who received \$57,717 in salaries and wages. Beaufort County alone accounted for 14 of these establishments.

Manufacturing.—There were 19 establishments in South Carolina in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 470 persons, who received \$220,353 in salaries and wages. The products manufactured, consisting principally of canned oysters, canned shrimp, and oyster-shell products, were valued at \$1,024,331. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

Fishermen's prepared products.—In addition to the output of prepared products by manufacturing firms, there were 264 fishermen in South Carolina preparing fishery products. Their output, consisting principally of salted mullet, amounted to 159,700 pounds, valued at \$14,890.

GEORGIA

The fisheries and industries related to the fisheries of Georgia in 1929 employed 1,890 fishermen, which is 65 per cent less than the number employed during 1928. Of the total number of persons, 1,180 were fishermen, 17 were employed on transporting boats, 285 in the wholesale trade, and 408 in manufacturing industries.

The total catch amounted to 43,513,641 pounds valued at \$877,232, which is an increase of 3 per cent in the catch and 1 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, shrimp accounted for 66 per cent; shad, 13 per cent; and menhaden, 12 per cent. Of the total weight of the catch, that of menhaden accounted for 67 per cent and shrimp 28 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Georgia during 1929 was taken by 1,180 fishermen who used 26 motor vessels, 681 motor and other small fishing boats, and 11 major types of gear. The vessels had a combined capacity of 349 net tons. The fisheries accounting for the greatest number of persons were the otter-trawl fishery employing 345 fishermen and the drift gill-net fishery employing 332 fishermen.

CATCH BY GEAR

Two types of gear accounted for 96 per cent of the fishery products taken in the fisheries of Georgia during 1929. Listed in order of their importance they were: Purse seines, which accounted for 67 per cent of the catch; and otter trawls, which accounted for 29 per cent. The catch by purse seines consisted entirely of menhaden and that by otter trawls principally shrimp.

OPERATING UNITS BY COUNTIES

Chatham County ranked foremost in the number of persons fishing, accounting for 41 per cent of the total. Glynn County followed with 24 per cent. Other counties employing a considerable number of fishermen listed in order of their importance in this respect were Camden, McIntosh, and Bryan. Glynn County and Chatham County each accounted for 38 per cent of the total number of fishing vessels. Chatham County led in the number of motor and other small fishing boats, accounting for 46 per cent of the total. Glynn County followed with 24 per cent.

CATCH BY COUNTIES

Fishing was prosecuted in the marine waters of 13 counties of Georgia during 1929. Ranked according to value, the fisheries of Glynn County were most important, accounting for 17 per cent of

the total catch and 39 per cent of the total value of the catch. Chatham County was next in importance, accounting for 8 per cent of the catch and 26 per cent of the value. Other important producing counties listed in order of their importance with respect to value of the catch were Camden and McIntosh.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 17 persons in Georgia engaged primarily in transporting fishery products by means of boats. In this trade 15 boats were operated.

Wholesale.—There were 32 wholesale establishments in Georgia engaged primarily in handling fresh and frozen products. These establishments employed 285 persons, who received \$157,029 in salaries and wages.

Manufacturing.—There were 11 establishments in Georgia in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 408 persons, who received \$164,789 in salaries and wages. The products manufactured, consisting principally of canned shrimp and oysters, and menhaden products, were valued at \$957,437. Detailed statistics of most of the production of

canned fishery products and by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

¹ Includes pickled shrimp prepared by one firm whose activities were principally in the wholesale fishery trade.

² A standard case contains forty-eight 5-ounce cans of oysters, forty-eight 5-ounce cans in dry pack, or forty-eight 5¼-ounce cans in the wet pack of shrimp.

³ Includes canned hard clam chowder, canned terrapin soup and meat, pickled shrimp in vinegar and menhaden products.

FLORIDA

The fisheries and industries related to the fisheries of Florida in 1929 employed 10,918 fishermen, which is 1 per cent more than the number employed in 1928. Of the total number of persons, 9,003 were fishermen, 41 were employed on transporting vessels, 1,387 in the wholesale trade, and 487 in manufacturing industries. Of the fishermen, 127 were engaged also in the manufacture of prepared fishery products.

The total catch amounted to 145,953,078 pounds, valued at \$6,119,947, which is an increase of 11 per cent in the catch and a decrease of 2 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, mullet accounted for 18 per cent; sponges and shrimp, each 14 per cent; and red snapper, 10 per cent. Of the total weight of the

catch, that of menhaden accounted for 35 per cent; mullet, 19 per cent; shrimp, 13 per cent; red snapper, 5 per cent; and Spanish mackerel, and catfish and bullheads, each 4 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Florida during 1929 was taken by 9,003 fishermen, who used 106 motor vessels, 8 sailing vessels, 6,573 motor and other small fishing boats, and 19 major types of gear. The vessels had a combined capacity of 3,897 net tons. The fisheries accounting for the greatest number of persons were the fishery with runaround gill nets, employing 2,498 fishermen, and the hand-line fishery, employing 1,950 fishermen.

CATCH BY GEAR

Five types of gear accounted for 95 per cent of the fishery products taken in the fisheries of Florida (including Lake Okeechobee) during 1929. Listed in order of their importance, they were: Purse seines, which accounted for 35 per cent of the catch; gill nets, 23 per cent; lines, 13 per cent; otter trawls, 13 per cent; and haul seines, 10 per cent. The catch by purse seines was almost exclusively menhaden; that by gill nets was principally mullet, Spanish mackerel, and squeteagues or "sea trout"; that by lines was principally red snapper, kingfish or "king mackerel" and groupers; that by otter trawls was principally shrimp; and that by haul seines chiefly mullet and catfish and bullheads.

OPERATING UNITS BY COUNTIES

Pinellas County led in the number of persons fishing, accounting for 12 per cent of the total. Escambia County followed, with 8 per cent. Other counties employing a considerable number of fishermen were: Monroe, Franklin, Charlotte, and Bay. Escambia County accounted for 32 per cent of the total number of fishing vessels and Bay County accounted for 16 per cent. Charlotte County led in the number of motor and other small fishing boats, accounting for 9 per cent of the total. Monroe and Pinellas Counties followed, each accounting for 8 per cent.

CATCH BY COUNTIES

Fishing was prosecuted in the waters of 39 counties in Florida (including Lake Okeechobee) during 1929. Ranked according to value the fisheries of Pinellas County were most important, accounting for 4 per cent of the catch and 18 per cent of the value of the catch. Escambia County was next in importance, accounting for 5 per cent of the catch and 8 per cent of the value. Other important counties, listed in order of their importance, with respect to the value of the catch, were: Nassau, Franklin, St. John, and Monroe.

CATCH BY DISTRICTS

Considered according to value of products taken during 1929, the west coast of Florida was by far the most important district in that State, accounting for 49 per cent of the total quantity and 63 per cent of the total value. The east coast of Florida accounted for 48 per cent of the total quantity and 34 per cent of the total value. Lake Okeechobee accounted for 3 per cent each of the quantity and value.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 41 persons in Florida engaged primarily in transporting fishery products by means of vessels. In this trade 18 motor vessels, having a combined capacity of 296 net tons, were operated. The size of vessel in most popular use ranged from 11 to 20 net tons.

Wholesale.—There were 246 wholesale establishments in Florida engaged primarily in handling fresh and frozen products. These establishments employed 1,387 persons who received \$747,243 in salaries and wages. The greatest concentration of these establishments was in Pinellas County, where 27 were operated.

Manufacturing.—There were 21 establishments in Florida in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 487 persons who received \$327,694 in salaries and wages. The products manufactured, consisting principally of canned shrimp and menhaden products, were valued at \$1,866,495. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095 "Fishery Industries of the United States, 1929."

Fishermen's prepared products.—In addition to the output of prepared products by manufacturing firms there were 127 fishermen employed who prepared fishery products. Their output, consisting principally of salted mullet, amounted to 369,147 pounds, valued at \$27,387.

¹ Includes the production of 19 firms whose activities were principally in the wholesale trade.

² A standard case contains forty-eight 5-ounce cans of oysters, forty-eight 5-ounce cans in the dry pack, or forty-eight 5¼-ounce cans in the wet pack of shrimp.

³ Includes canned clam and turtle products, shark products, oyster-shell products, shrimp meal, miscellaneous scrap and oil, and shell lamps.

SPONGE FISHERY

In the waters along the Gulf coast of Florida there is located the only commercial sponge fishery in the United States. During 1929 this fishery employed 855 fishermen, which is 5 per cent more than the number employed during 1928. Their catch amounted to 528,721 pounds, valued at \$879,646. This represents a decrease of 5 per cent in the catch, but an increase of 3 per cent in the value of the catch as compared with the catch and its value for the previous year. The greater part of the catch consisted of sheepswool sponges, although there were considerable quantities of yellow and grass sponges and a small production of wire sponges.

Operating units.—In making the catch, the fishermen employed 5 motor vessels, 2 sailing vessels, 412 motor and other small fishing boats, 278 sponge hooks, and 51 diving outfits. The vessels had a combined capacity of 85 net tons.

Marketing the sponges.—The greater portion of the catch landed at Tarpon Springs is marketed through the Sponge Exchange located there. During 1929 sponges, amounting to 378,514 pounds, valued at \$706,645, were handled on the exchange. This represents 72 per cent of the quantity of the entire Florida catch and 80 per cent of the value. Transactions are made on the exchange at auction, and bidders represent merchants in various sections of this and foreign countries.

Our imports of sponges in 1929, which originated mostly from Cuba, although considerable quantities come from the British West Indies, amounted to 856,515 pounds, valued at \$1,091,129. Our exports during 1929 which were forwarded mainly to the United Kingdom, Canada, Argentina, France, Italy, Egypt, and the Netherlands, amounted to 124,443 pounds, valued at \$151,933. The net consumption of sponges in 1929 in the United States, computed by adding the volume of imports for domestic consumption to the domestic production and deducting the exports, amounted to 1,260,793 pounds, valued at \$1,818,842.

Sponges are utilized in the arts and industries, such as in applying a glaze to pottery, for the toilet, and for cleaning automobiles and other vehicles. Some also are used in surgical work.

During 1930 sponges handled on the exchange amounted to 414,082 pounds valued at \$802,938. This is an increase of 9 per cent in quantity and 14 per cent in value as compared with the quantity and value of the transactions on the exchange during 1929. However, it represents a decrease of 8 per cent in quantity and an increase of 14 per cent in value as compared with the average quantity and value of the transactions over the 5-year period from 1922 to 1926. It is estimated that the value of sponges sold outside of the exchange during 1930 amounted to \$75,000. Of the total sponges sold on the exchange in 1930, 258,110 pounds, valued at \$689,670, were large wool; 41,434 pounds, valued at \$60,908, were small wool; 57,039 pounds, valued at \$33,083, were yellow; 54,208 pounds, valued at \$17,346, were grass; and 3,291 pounds, valued at \$1,931, were wire sponges.

ALABAMA

The fisheries and industries related to the fisheries of Alabama in 1929 employed 1,095 persons, which is 11 per cent less than the number employed in 1928. Of the total number of persons, 781 were fishermen, 12 were employed on transporting vessels, 95 in the wholesale trade, and 207 in manufacturing industries. Of the fishermen, 2 were engaged also in the manufacturing of prepared fishery products.

The total catch amounted to 9,024,539 pounds, valued at \$410,325, which is a decrease of 38 per cent in the catch and 30 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, shrimp accounted for 38 per cent; red snapper, 25 per cent; and mullet, 18 per cent. Of the total weight of the catch, shrimp accounted for 49 per cent; mullet, 18 per cent; and red snapper, 14 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Alabama during 1929 was taken by 781 fishermen, who used 34 motor vessels, 4 sailing vessels, 449 motor and other small boats, and 9 major types of gear. The vessels had a combined capacity of 430 net tons. The fisheries accounting for the greatest number of persons were the otter-trawl fishery employing 285 fishermen and the hand-line fishery employing 148 fishermen.

CATCH BY GEAR

Four types of gear accounted for 94 per cent of fishery products taken in the fisheries of Alabama during 1929. Listed in order of their importance they were: Otter trawls, which accounted for 49 per cent of the catch; trammel nets, 18 per cent; lines, 17 per cent; and haul seines, 10 per cent. The catch by otter trawls consisted almost exclusively of shrimp; that by trammel nets principally mullet; that by lines chiefly red snapper; and that by haul seines principally mullet.

OPERATING UNITS BY COUNTIES

Fisheries of Alabama are confined to Baldwin and Mobile Counties. Mobile County accounted for 83 per cent of the number of persons fishing, 82 per cent of the fishing vessels, and 80 per cent of the motor and other small fishing boats.

CATCH BY COUNTIES

Of the two counties of Alabama in which marine fisheries were prosecuted during 1929, Mobile County was by far the most important, accounting for 85 per cent of the total catch and 84 per cent of the total value of the catch. Baldwin County accounted for the remaining 15 per cent of the catch and 16 per cent of the value.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 12 persons in Alabama engaged primarily in transporting fishery products by means of vessels. In this trade 6 motor vessels, having a combined capacity of 55 net tons,

were operated. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 10 wholesale establishments in Alabama engaged primarily in handling fresh and frozen products. These establishments employed 95 persons, who received \$85,153 in salaries and wages. All of the wholesale establishments were located in Mobile and Baldwin Counties.

Manufacturing.—There were seven establishments in Alabama in 1929 engaged primarily in the manufacturing of fishery products or by-products. They employed 207 persons, who received \$87,404 in salaries and wages. The products manufactured, consisting principally of canned shrimp and oysters, and salted mullet, were valued at \$442,002. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

Fishermen's prepared products.—In addition to the output of prepared products by manufacturing firms, there were two fishermen in Alabama preparing fishery products. Their output, consisting entirely of sturgeon roe, amounted to 109 pounds, valued at \$88.

¹ Includes a small amount of salted products prepared by 4 firms whose activities were principally in the wholesale fishery industry.

² A standard case contains forty-eight 5-ounce cans of oysters, forty-eight 5-ounce cans in the dry pack or forty-eight 5¼-ounce cans in the wet pack of shrimp.

³ Includes salted mullet roe, shrimp meal, and oyster-shell products.

MISSISSIPPI

The fisheries and industries related to the fisheries of Mississippi in 1929 employed 3,854 persons, which is 19 per cent more than the number employed during 1928. Of the total number of persons, 2,447 were fishermen, 6 were employed on transporting vessels, 317 in the wholesale trade, and 1,084 in manufacturing industries.

The total catch amounted to 34,629,156 pounds, valued at \$1,-005,301, which is an increase of 13 per cent in the catch but a decrease of 5 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, oysters accounted for 45 per cent and shrimp 42 per cent. Of the total weight of the catch, oysters accounted for 54 per cent; shrimp, 13 per cent; and crabs, 4 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Mississippi during 1929 was taken by 2,447 fishermen, who used 124 motor vessels, 14 sailing vessels, 1,184 motor and other small fishing boats, and 9 major types of gear. The vessels had a combined capacity of 1,885 net tons. The fisheries accounting for the greatest number of persons were the otter-trawl fishery employing 975 fishermen, the oyster dredge fishery employing 878 fishermen, and the tong fishery employing 513 fishermen.

CATCH BY GEAR

Two types of gear caught 86 per cent of the fishery products taken in the marine fisheries of Mississippi during 1929. Listed in order of their importance they were: Dredges, which accounted for 49 per cent of the catch; and otter trawls, which accounted for 37 per cent of the catch. The catch by dredges was entirely oysters and that by otter trawls was principally shrimp.

OPERATING UNITS BY COUNTIES

Only three counties in Mississippi are represented in the marine fisheries. Harrison was by far the most important of these, accounting for 84 per cent of the total number of fishermen, 95 per cent of the total number of vessels, and 78 per cent of the small fishing boats. Jackson County ranked second with 13 per cent of the fishermen, 5 per cent of the vessels, and 19 per cent of the small fishing boats.

CATCH BY COUNTIES

Of the three counties represented in the marine fisheries of Mississippi, Harrison County accounted for 88 per cent of the total catch and 83 per cent of the total value of the catch. Jackson County ranked second with 10 per cent of the catch and 14 per cent of the value, while Hancock County accounted for 1 per cent of the catch and 3 per cent of the value.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 6 persons in Mississippi engaged primarily in transporting fishery products by means of vessels. In this trade 2 motor vessels and 1 sailing vessel, having a combined capacity of 36 net tons, were operated.

Wholesale.—There were 25 wholesale establishments in Mississippi engaged primarily in handling fresh and frozen products. These establishments employed 317 persons who received \$127,496 in salaries and wages. Harrison County alone accounted for 19 of these establishments.

Manufacturing.—There were 29 establishments in Mississippi in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 1,084 persons, who received \$528,089 in salaries and wages. The products manufactured, consisting principally of canned shrimp and oysters, and oyster-shell products, were valued at \$2,533,466. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

¹ Includes the production of 2 firms whose activities were principally in the wholesale trade.

² A standard case contains forty-eight 5-ounce cans of oysters; forty-eight 5-ounce cans in the dry pack, of forty-eight 5¼-ounce cans in the wet pack of shrimp.

³ Includes salted mullet, canned crabs, and shrimp meal.

LOUISIANA

The fisheries and industries related to the fisheries of Louisiana in 1929 employed 5,918 persons, which is 13 per cent less than the number employed in 1928. Of the total number of persons employed, 3,709 were fishermen, 472 were engaged on transporting vessels and boats, 372 in the wholesale trade, and 1,665 in manufacturing industries. Of the number employed on transporting vessels and boats, 300 represent a duplication of those persons shown as fishermen. Of the fishermen, 3 also were engaged in the manufacture of prepared fishery products.

The total catch amounted to 61,919,905 pounds, valued at \$2,764,-673, which is a decrease of 11 per cent in the catch and 21 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, that of shrimp accounted for 73 per cent; oysters, 16 per cent; and crabs, 4 per cent. Of the total weight of the catch, shrimp accounted for 80 per cent; oysters, 13 per cent; and crabs, 4 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Louisiana during 1929 was taken by 3,709 fishermen who used 103 motor vessels, 2,305 motor and other small boats, and 7 major types of gear. The vessels had a combined

capacity of 741 net tons. The fisheries accounting for the greatest number of persons were the otter-trawl fishery employing 2,018 fishermen and the haul-seine fishery employing 763 fishermen.

CATCH BY GEAR

Three types of gear accounted for 90 per cent of the fishery products taken in the fisheries of Louisiana during 1929. Listed in order of their importance they were: Otter trawls, which accounted for 74 per cent of the catch; tongs, 9 per cent; and haul seines, 7 per cent. The catch by otter trawls was exclusively shrimp, that by tongs entirely oysters, and that by haul seines principally shrimp.

OPERATING UNITS BY PARISHES

Terrebonne Parish was foremost in the number of persons fishing, accounting for 22 per cent of the total. Jefferson Parish followed with 20 per cent. Other parishes employing a considerable number of fishermen listed in order of their importance in this respect were La Fourche, Plaquemines, and St. Bernard. Terrebonne Parish accounted for 38 per cent of the total number of fishing vessels and La Fourche Parish 28 per cent. Terrebonne Parish also led in the number of motor and other small fishing boats, accounting for 23 per cent of the total. Jefferson Parish followed with 19 per cent.

CATCH BY PARISHES

Fishing was prosecuted in the marine waters of 14 parishes of Louisiana during 1929. Ranked according to value, the fisheries of La Fourche Parish were most important, accounting for 25 per cent of the total catch and 23 per cent of the total value of the catch. Jefferson Parish ranked second, accounting for 24 per cent of the total catch and 23 per cent of the value. Other important producing parishes listed in order with respect to value of the catch were Terrebonne, Plaquemines, Orleans, and St. Bernard.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—In 1929 there were 472 persons in Louisiana engaged primarily in transporting fishery products by means of vessels and boats. In this trade 83 motor vessels, having a combined capacity of 633 net tons, and 214 undertonnage boats were operated. The size of vessel in most popular use ranged from 5 to 10 net tons.

Wholesale.—There were 33 wholesale establishments in Louisiana primarily engaged in handling fresh and frozen products. These establishments employed 372 persons who received \$313,446 in salaries and wages. Orleans Parish alone accounted for 13 of these establishments.

Manufacturing.—There were 56 establishments in Louisiana in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 1,665 persons, who received \$680,510 in salaries and wages. The products manufactured, consisting princi-

pally of dried and canned shrimp and oyster-shell products, were valued at \$4,949,682. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095 entitled "Fishery Industries of the United States, 1929."

Fishermen's prepared products.—In addition to the output of prepared products by manufacturing firms, there were 3 fishermen in Louisiana preparing fishery products. Their output, consisting of dried shrimp and shrimp bran, amounted to 2 tons, valued at \$508.

TEXAS

The fisheries and industries related to the fisheries of Texas in 1929 employed 2,543 persons, which is 12 per cent less than the number employed during 1928. Of the total number of persons, 1,977 were fishermen, 361 were engaged in the wholesale trade, and 205 in manufacturing industries.

The total catch amounted to 16,624,114 pounds, valued at \$907,342, which is an increase of 9 per cent in the catch and 4 per cent in the value of the catch, as compared with the catch and its value in the previous year. Of the total value of the catch, that of shrimp accounted for 36 per cent; squeteagues or "sea trout," 18 per cent; oysters, 16 per cent; and red drum, 12 per cent. Of the total weight of the catch, that of shrimp accounted for 57 per cent; oysters, 15 per cent; squeteagues, 7 per cent; black and red drum, each 6 per cent; and red snapper, 5 per cent.

OPERATING UNITS BY GEAR

The catch of fishery products in Texas during 1929 was taken by 1,977 fishermen who used 41 motor vessels, 1,372 motor and other small boats, and 11 major types of gear. The vessels had a combined capacity of 485 net tons. The fisheries accounting for the greatest number of persons were the hand-line fishery employing 526 fishermen and the otter-trawl fishery employing 454 fishermen.

CATCH BY GEAR

Four types of gear accounted for 86 per cent of the fishery products taken in the fisheries of Texas during 1929. Listed in order of their importance they were: Otter trawls which accounted for 57 per cent of the catch; haul seines, 12 per cent; lines, 9 per cent; and tongs, 8 per cent. The catch by otter trawls was exclusively shrimp; that by haul seines, principally black drum, squeteagues, and red drum; that by lines, principally red snapper, squeteagues, and red drum; and that by tongs, exclusively oysters.

OPERATING UNITS BY COUNTIES

Neuces County was foremost in the number of persons fishing, accounting for 27 per cent of the total number. Galveston County followed with 22 per cent. Other counties employing a considerable number of persons listed in order of their importance in this respect were Calhoun, Cameron, and Aransas. Galveston County accounted

for 39 per cent of the total number of fishing vessels and Calhoun, 22 per cent. Neuces County led in the number of motor and other small boats, accounting for 25 per cent of the total and was followed by Galveston County with 24 per cent.

CATCH BY COUNTIES

Fishing was prosecuted in the marine waters of 12 counties of Texas during 1929. Ranked according to value, the fisheries of Galveston County were most important, accounting for 32 per cent of the total catch and 33 per cent of the total value of the catch. Neuces County was next in importance accounting for 21 per cent of the quantity and 19 per cent of the value. Other important producing counties listed in order of their importance with respect to the value of the catch were Calhoun, San Patricio, Cameron, Matagorda, and Aransas.

INDUSTRIES RELATED TO THE FISHERIES

Wholesale.—There were 62 wholesale establishments in Texas in 1929 engaged primarily in handling fresh and frozen products. These establishments employed 361 persons, who received \$183,105 in salaries and wages.

Manufacturing.—There were 9 establishments in Texas in 1929 engaged primarily in the manufacture of fishery products or by-products. They employed 205 persons, who received \$103,452 in salaries and wages. The products manufactured, consisting principally of canned shrimp, were valued at \$402,613. Detailed statistics of most of the production of canned fishery products and by-products may be obtained from Fisheries Document No. 1095, entitled "Fishery Industries of the United States, 1929."

Industries related to the fisheries of Texas, 1929

		Total		402,613
Paid to salaried employees	\$21,520			
Paid to wage earners	81,932			
Total salaries and wages	103,452			

¹ A standard case contains forty-eight 5-ounce cans in the dry pack or forty-eight 5¾-ounce cans in the wet pack of shrimp.

² Includes canned oysters, salt shrimp, and oyster-shell products.

HISTORICAL REVIEW

Thirteen general surveys have been made for statistics of the fisheries of the South Atlantic and Gulf States during the 50 years from 1880 to 1929. Beginning with a catch of 66,513,000 pounds in 1880 it constantly increased until 1918 when the second largest catch on record was taken, due principally to the large catch of menhaden in that year. In 1929 the largest catch on record was taken, amounting to 535,395,000 pounds. Comparative statistics for the catch of each of the more important species throughout this period are shown in the following tables:

Fisheries of the South Atlantic and Gulf States, 1880 to 1929

FISHERIES OF THE PACIFIC COAST STATES⁴

During 1929 the value of the catch of fishery products in the Pacific Coast States (Washington, Oregon, and California) exceeded that in any year for which there are records. This was due mainly to the increased production of salmon and pilchard, or sardine. These fisheries gave employment to 19,992 fishermen, or 1 per cent more than in 1928. Of the total number of fishermen employed during 1929, 5,822 were engaged on vessels and 14,170 were employed in the shore and boat fisheries. Their catch amounted to 1,034,433,666 pounds, valued at \$25,038,414. This is an increase of 47 per cent in the catch and 22 per cent in the value of the catch as compared with the quantity and its value for 1928. Of the total catch in 1929, 1,012,728,784 pounds, valued at \$23,097,280, were fish; 16,166,888 pounds, valued at \$1,572,437, were shellfish and miscellaneous products; and 5,537,994 pounds, valued at \$368,697, were whale products.

Based on the value to the fishermen, salmon with a production of 141,892,471 pounds, valued at \$9,607,043, was by far the most important fishery product taken on the Pacific coast. Pilchard, or sardine, ranked second with a production of 651,802,019 pounds, valued at \$3,587,765. Other important species were yellowfin tuna, 37,398,661 pounds, valued at \$2,200,366; halibut, 10,419,779 pounds, valued at \$1,471,541; and skipjack or striped tuna, 26,997,611 pounds, valued at \$1,080,771. Other products were valued individually at less than \$1,000,000.

⁴ Data on the operating units and catch of the fisheries of the Pacific Coast States have been taken largely from statistics collected by the various State fisheries agencies. Supplementary surveys, compilations, and analyses have been made by agents of this bureau in order that the figures may be presented in a manner comparable with those of other sections.

The industries related to the fisheries of the Pacific Coast States gave employment to 11,987 persons, of whom 310 were engaged in transporting fishery products, 1,373 were in the wholesale industry and received \$2,300,500 in salaries and wages, and 10,304 were in the manufacturing industry and received \$6,859,656 in salaries and wages. There were 120 establishments in the wholesale industry handling primary products and 169 establishments were in the manufacturing industry. The latter manufactured products, valued at \$50,498,558, consisting principally of canned salmon, tuna and tunalike fishes, and sardines.

FIGURE 20.—Yield of principal fishery products in the Pacific Coast States, 1929

WASHINGTON

In 1929 Washington ranked second among the Pacific Coast States in the importance of its fisheries, employing 45 per cent of the total number of fishermen and accounting for 15 per cent of the total catch. There were 9,027 fishermen employed, which is 3 per cent more than in 1928. Of the total number of fishermen, 2,312 were employed on fishing vessels and 6,715 in the shore and boat fisheries.

The catch amounted to 152,223,943 pounds, valued at \$9,562,777. This is an increase of 84 per cent in the catch and 28 per cent in the value of the catch as compared with the catch and its value for 1928. Of the total value of the catch, salmon accounted for 71 per cent; halibut, 14 per cent; oysters, 4 per cent; and cod, 3 per cent. Of the total catch, salmon accounted for 77 per cent; cod, 9 per cent; halibut, 6 per cent; and sablefish, steelhead trout, smelt, crabs, clams, and "lingcod," each, 1 per cent.

Operating units.—The catch of the fishery products from the Puget Sound, coastal, and Columbia River districts of Washington was taken by 9,027 fishermen, 2 steam vessels, 303 motor vessels, 7 sailing vessels, 3,248 motor and other small boats, and 15 major types of gear. The vessels had a combined net tonnage of 8,627 net tons.

PUGET SOUND DISTRICT

The Puget Sound district is comprised of Whatcom, Skagit, Snohomish, King, Pierce, Thurston, Mason, Kitsap, Island, and San Juan Counties and parts of Jefferson and Clallam Counties. The catch in this district in 1929 amounted to 129,517,078 pounds, valued at \$7,682,622. Of the more important species comprising this catch, salmon amounted to 99,830,801 pounds, valued at \$5,403,831; halibut, 9,136,168 pounds, valued at \$1,310,983; oysters, 633,656 pounds, valued at \$360,936; cod, 13,531,973 pounds, valued at \$268,341; and sablefish, 2,074,603 pounds, valued at \$127,128.

Operating units.—The catch of fishery products in the Puget Sound district was taken by 4,302 fishermen who used 2 steam vessels, 294 motor vessels, 7 sailing vessels, 1,432 motor and other small boats, and 13 major types of gear. The vessels had a combined capacity of 8,538 net tons.

Catch by gear.—Three types of gear accounted for 95 per cent of the fishery products taken in the Puget Sound district during 1929. Listed in the order of their importance they were: Purse seines, which accounted for 44 per cent of the catch; lines, 26 per cent; and pound nets, 25 per cent. The catch by purse seines and pound nets was almost entirely salmon; and that by lines was principally cod, halibut, salmon, and sablefish.

COASTAL DISTRICT

The coastal district is comprised of Grays Harbor County and parts of Jefferson, Clallam, and Pacific Counties. The catch in the coastal district amounted to 9,098,732 pounds, valued at \$582,122. Considered according to value the important species comprising this catch were salmon, 7,059,942 pounds, valued at \$289,722; razor clams, 1,058,516 pounds of meats, valued at \$191,121; and crabs, 793,550 pounds, valued at \$69,436.

Operating units.—The catch of fishery products in the coastal district of Washington during 1929 was taken by 2,873 fishermen who used 1 motor vessel, 569 motor and other small boats, and 7 major types of gear. The motor vessel had a capacity of 8 tons.

Catch by gear.—Six types of gear accounted for over 99½ per cent of the fishery products taken in this district during 1929. In the order of their importance they were: Pound nets, which accounted for 34 per cent of the catch; gill nets, 34 per cent, which included a negligible amount taken by spears; shovels, 12 per cent; lines, 11 per cent; and crab traps, 9 per cent. The catch by pound nets, gill

nets and spears, and lines consisted almost entirely of salmon, that by shovels entirely razor clams, and that by crab traps exclusively crabs.

COLUMBIA RIVER DISTRICT

The Columbia River district is comprised of Wahkiakum, Cowlitz, Clarke, Skamania, Klickitat, Benton, Walla Walla, and Asotin Counties, and part of Pacific County. The catch in this district amounted to 13,608,133 pounds, valued at \$1,298,033. Considered according to value the more important species comprising this catch were salmon, 9,854,333 pounds, valued at \$1,108,462, and steelhead trout, 1,512,233 pounds, valued at \$136,102.

Operating units.—The catch of fishery products in the Columbia River district of Washington during 1929 was taken by 1,852 fishermen, who used 8 motor vessels, 1,247 motor and other small boats, and 6 major types of gear. The motor vessels had a capacity of 81 net tons.

Catch by gear.—Five types of gear accounted for 97 per cent of the fishery products taken in this district during 1929. In the order of their importance they were pound nets, which accounted for 35 per cent of the catch; gill nets, 33 per cent; dip nets and haul seines, each, 11 per cent; and lines, 7 per cent. The catch by pound nets, gill nets, haul seines, and lines was principally salmon; and that by dip nets was mainly smelt.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—There were 204 persons engaged in Washington during 1929 in transporting the catch of fish. In this trade 84 motor vessels, having a capacity of 1,607 net tons, were operated.

Wholesale.—There were 39 wholesale establishments in the Puget Sound, coastal, and Columbia River districts of Washington engaged chiefly in the handling of fresh and frozen products. These establishments employed 443 persons, who received \$729,683 in salaries and wages.

Manufacturing.—There were 76 establishments in Washington engaged primarily in the manufacture of prepared fishery products or by-products. They employed 2,456 persons who received \$1,425,897 in salaries and wages. The products manufactured, consisting principally of canned, mild-cured, and kippered salmon and canned clams, were valued at \$13,858,998. Detailed statistics of most of the items manufactured may be obtained from Fisheries Document No. 1095, "Fishery Industries of the United States, 1929."

¹ Cod were salted in Alaska waters.

² Includes a small amount of silver or coho salmon.

³ A standard case contains forty-eight 1-pound cans of salmon, shad, shad roe, and salmon eggs or 48 No. 1 cans of clam products.

⁴ Includes canned crabs, and herring (for bait).

OREGON

In 1929 Oregon employed 21 per cent of the total number of fishermen and accounted for 2 per cent of the total catch of the Pacific coast section. There were 4,193 fishermen employed, which is 2 per cent more than in 1928. Of this total, 118 were employed on fishing vessels and 4,075 in the shore and boat fisheries. The catch amounted to 25,283,649 pounds, valued at \$2,605,153. This is a decrease of 8 per cent in the catch and 3 per cent in the value of the catch, as compared with the catch and its value for 1928. Of the total value of the catch, salmon accounted for 86 per cent and steelhead trout 6 per cent. Of the total production, salmon accounted for 80 per cent; steelhead trout, 6 per cent; and shad, 5 per cent.

Operating units.—The catch of fishery products from the Columbia River and coastal districts of Oregon was taken by 4,193 fishermen, 44 motor vessels, 2,484 motor and other small boats, and 8 major types of gear. The vessels had a combined capacity of 422 net tons.

COLUMBIA RIVER DISTRICT

The Columbia River district is comprised of Columbia, Washington, Multnomah, Hood River, Wasco, Clackamas, Marion, and Yamhill Counties and part of Clatsop County. The catch in this district amounted to 15,719,831 pounds, valued at \$1,861,309. Considered according to value the more important species comprising this catch were: Salmon, 12,969,018 pounds, valued at \$1,673,496; steelhead trout, 1,325,961 pounds, valued at \$119,322; and halibut, 133,338 pounds, valued at \$19,941.

Operating units.—The catch of fishery products in the Columbia River district of Oregon during 1929 was taken by 2,769 fishermen, who used 32 motor vessels, 1,475 motor and other small boats, and 6 major types of gear. The combined capacity of the vessels amounted to 295 net tons.

Catch by gear.—Four types of gear accounted for 98 per cent of the fishery products taken in this district during 1929. Listed in order of their importance they were: Gill nets, which accounted for 58 per cent of the catch; lines, 18 per cent; haul seines, 17 per cent; and pound nets, 5 per cent. The catch by each of these gears was principally salmon and steelhead trout.

Fisheries of the Columbia River district of Oregon, 1929

COASTAL DISTRICT

The coastal district is comprised of Tillamook, Lincoln, Lane, Douglas, Coos, and Curry Counties, and part of Clatsop County. The catch in this district amounted to 9,563,818 pounds, valued at \$743,844. Considered according to value, the more important species were: Salmon, 7,133,506 pounds, valued at \$572,065; halibut, 382,241 pounds, valued at \$49,865; and steelhead trout, 221,553 pounds, valued at \$26,517.

Operating units.—The catch of fishery products in the coastal district of Oregon during 1929 was taken by 1,424 fishermen, who used 12 motor vessels, 1,009 motor and other small boats, and 6 major types of gear. The combined capacity of the vessels was 127 net tons.

Catch by gear.—Two types of gear accounted for 89 per cent of the catch of fishery products taken in this district during 1929. Listed in order of their importance they were: Gill nets, which accounted for 57 per cent, and lines, 32 per cent. The catch by gill nets was principally salmon and that by lines principally salmon, halibut, and "lingcod."

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—There were 50 persons in Oregon during 1929 engaged in transporting the catch of fish. In this trade 28 motor vessels having a total capacity of 301 net tons, were operated.

Wholesale.—There were 20 wholesale establishments in the Columbia River and coastal districts of Oregon engaged primarily in handling fresh and frozen products. These establishments employed 118 persons, who received \$127,679 in salaries and wages.

Manufacturing.—There were 29 establishments in Oregon during 1929 engaged primarily in the manufacture of prepared fishery products or by-products. They employed 872 persons, who received \$763,516 in salaries and wages. The products manufactured, consisting principally of canned and mild-cured salmon, were valued at \$5,658,861. Detailed statistics of most of the items manufactured may be obtained from Fisheries Document No. 1095, "Fishery Industries of the United States, 1929."

CALIFORNIA

In 1929 California was by far the most important among the Pacific Coast States in regard to fisheries, employing 34 per cent of the total number of fishermen and accounting for 83 per cent of the total catch. There were 6,772 fishermen employed, which is 1 per cent less than in 1928. Of this number 3,392 were engaged on fishing vessels and 3,380 in the shore and boat fisheries.

The catch amounted to 856,926,074 pounds, valued at \$12,870,484. This is an increase of 47 per cent in the catch and 25 per cent in the value of the catch as compared with the catch and its value for 1928. Of the total value of the catch, that for pilchard or sardine accounted for 28 per cent; yellowfin tuna, 17 per cent; skipjack or striped tuna, 8 per cent; mackerel, 7 per cent; flounders, 6 per cent; and salmon, barracuda, and bluefin tuna, each, 4 per cent. Of the total production, pilchard or sardine accounted for 76 per cent; mackerel, 7 per cent; yellowfin tuna, 4 per cent; skipjack or striped tuna, 3 per cent; and flounders, 2 per cent. Of the total catch, 787,385,866 pounds valued at \$9,145,369 were taken off the coast of California.

The remainder of the catch was taken off the coast of Latin America, except the cod which was taken in Alaska waters.

Operating units.—The catch of fishery products from the northern San Francisco, Monterey, and southern districts of California was taken by 6,772 fishermen, 5 steam vessels, 437 motor vessels, 2 sailing vessels, 1,927 motor and other small boats, and 16 major types of gear. The vessels had a combined capacity of 12,313 net tons.

SAN FRANCISCO DISTRICT

The San Francisco district is comprised of Marin, Solano, Yolo, Sacramento, San Joaquin, Alameda, Contra Costa, San Francisco, and San Mateo Counties. The catch in this district amounted to 77,127,313 pounds, valued at \$1,956,160. Considered according to value, the more important species comprising this catch were: Flounders, 12,101,717 pounds, valued at \$549,353; whale products, 5,537,994 pounds, valued at \$368,697; pilchard or sardine, 41,091,857 pounds, valued at \$215,597; crabs, 1,691,784 pounds, valued at \$154,345; and salmon, 1,240,215 pounds, valued at \$142,958.

Operating units.—The catch of fishery products in the San Francisco district during 1929 was taken by 1,263 fishermen, 5 steam vessels, 29 motor vessels, 2 sailing vessels, 642 motor and other small boats, and 12 major types of gear. The combined capacity of the vessels amounted to 1,504 net tons.

Catch by gear.—Five types of gear accounted for 92 per cent of the fishery products taken in this district during 1929. Listed in the order of their importance they were: Lampara nets, which accounted for 54 per cent; paranzella nets, 18 per cent; lines, 8 per cent; harpoons, 7 per cent; and gill nets, 5 per cent. The catch by lampara nets was chiefly pilchard or sardine, that by paranzella nets principally flounders, that by lines largely cod taken in Alaska waters, that by harpoons exclusively whales, and that by gill nets chiefly shad, herring, salmon, and striped bass.

MONTEREY DISTRICT

The Monterey district is comprised of Monterey and Santa Cruz Counties. The catch in this district amounted to 334,877,517 pounds, valued at \$2,339,705. The most important product contributing to this catch was pilchard or sardine, the catch of which amounted to 323,381,282 pounds, valued at \$1,787,597. Other important species were abalone, 682,474 pounds, valued at \$136,495; salmon, 1,054,096 pounds, valued at \$123,781; rockfishes, 1,641,049 pounds, valued at \$75,955; and squid, 4,572,555 pounds, valued at \$72,243.

Operating units.—The catch of fishery products in the Monterey district in 1929 was taken by 1,197 fishermen, 36 motor vessels, 285 motor and other small boats, and 10 major types of gear. The combined capacity of the vessels amounted to 526 net tons.

Catch by gear.—Three types of gear accounted for 99 per cent of the fishery products taken in this district during 1929. Listed in the order of their importance, they were: Lampara nets, which accounted for 76 per cent of the catch; purse seines, 22 per cent; and lines, 1 per cent. The catch by lampara nets was principally sardine or pilchard, that by purse seines almost exclusively pilchard or sardine, and that by lines chiefly rockfishes, salmon, and mackerel.

SOUTHERN DISTRICT

The combined catch of the San Pedro and San Diego divisions, which comprise the southern district, amounted to 439,632,445 pounds, valued at \$8,114,565. This includes the catch off the coast of California and that off the coast of Latin America. Considered according to value the more important species contributing to this catch were: Yellowfin tuna, 37,398,661 pounds, valued at \$2,200,366; pilchard or sardine, 287,298,765 pounds, valued at \$1,584,270; skipjack or striped tuna, 26,997,611 pounds, valued at \$1,080,771; and mackerel, 56,921,321 pounds, valued at \$845,595.

The operating units and catch of the principal species are discussed for each division individually in the following paragraphs.

SAN PEDRO DIVISION

The San Pedro division is comprised of San Luis Obispo, Santa Barbara, Ventura, Los Angeles, and Orange Counties.

Operating units.—The catch of fishery products in the San Pedro division was taken by 2,802 fishermen, 249 motor vessels, 459 motor and other small boats, and 10 major types of gear. The combined capacity of the vessels amounted to 6,335 net tons.

OFF CALIFORNIA

That part of the catch in this division taken off the California coast amounted to 352,705,894 pounds, valued at \$3,763,168. Considered according to value the more important species were: Pilchard or sardine, 283,369,382 pounds, valued at \$1,558,531; mackerel, 47,898,798 pounds, valued at \$725,834; and bluefin tuna, 6,213,842 pounds, valued at \$410,913.

Catch by gear.—Three types of gear accounted for 99 per cent of the fishery products taken off the California coast and landed in San Pedro division during 1929. In order of their importance they were: Lampara nets, which accounted for 52 per cent of the catch; purse seines, 43 per cent; and lines, 4 per cent. The catch by lampara nets was principally pilchard or sardine and mackerel; that by purse seines principally pilchard or sardine, bluefin tuna, and mackerel; and that by lines chiefly mackerel, skipjack or striped tuna, and rockfishes.

OFF LATIN AMERICA

That part of the catch of the San Pedro division taken off the coast of Latin America amounted to 23,746,448 pounds, valued at \$1,226,623. Considered according to value the more important species were: Yellowfin tuna, 11,911,883 pounds, valued at \$634,685; skipjack or striped tuna, 6,791,701 pounds, valued at \$247,886; and barracuda, 1,007,628 pounds, valued at \$155,007.

Catch by gear.—Two types of gear accounted for 99 per cent of the fishery products taken off the coast of Latin America and landed in the San Pedro division during 1929. Of these, lines accounted for 61 per cent and purse seines 38 per cent. The catch by lines was principally yellowfin tuna and skipjack or striped tuna, and that by purse seines principally yellowfin tuna, bonito, and barracuda.

² Includes canned oysters, salt shrimp, and oyster-shell products.

HISTORICAL REVIEW

Thirteen general surveys have been made for statistics of the fisheries of the South Atlantic and Gulf States during the 50 years from 1880 to 1929. Beginning with a catch of 66,513,000 pounds in 1880 it constantly increased until 1918 when the second largest catch on record was taken, due principally to the large catch of menhaden in that year. In 1929 the largest catch on record was taken, amounting to 535,395,000 pounds. Comparative statistics for the catch of each of the more important species throughout this period are shown in the following tables:

Fisheries of the San Pedro division of the southern district of California, 1929—

SAN DIEGO DIVISION

The San Diego division is comprised of San Diego and Imperial Counties.

Operating units.—The catch of fishery products in the San Diego division was taken by 978 fishermen, 109 motor vessels, 165 motor and other small boats, and 7 major types of gear. The combined capacity of the vessels amounted to 3,800 net tons.

OFF CALIFORNIA

That part of the catch taken off the California coast of the San Diego division amounted to 22,301,494 pounds, valued at \$708,792. Considered according to value the more important species were skipjack or striped tuna, 3,223,636 pounds, valued at \$129,176; mackerel, 9,021,118 pounds, valued at \$119,718; and rockfishes, 1,414,924 pounds, valued at \$79,263.

Catch by gear.—Three types of gear accounted for 94 per cent of the fishery products taken off the coast of California and landed in the San Diego division during 1929. In the order of their importance they were: Lampara nets, which accounted for 45 per cent of the catch; lines, 43 per cent; and purse seines, 6 per cent. The catch by lampara nets was made up principally of mackerel and pilchard or sardine; that by lines was chiefly skipjack or striped tuna, mackerel, and rockfishes; and that by purse seines was almost exclusively bluefin tuna.

OFF LATIN AMERICA

That part of the catch of the San Diego division taken off the Latin America coast amounted to 40,878,609 pounds, valued at \$2,415,982. Considered according to value the more important species were: Yellowfin tuna, 25,287,334 pounds, valued at \$1,552,909; skipjack or striped tuna, 12,173,833 pounds, valued at \$494,830; and sea crawfish or spiny lobster, 994,908 pounds, valued at \$183,380.

Catch by gear.—Three types of gear accounted for 98 per cent of the catch of fishery products taken off the coast of Latin America and landed in the San Diego division. Lines accounted for 94 per cent of the catch, and traps and purse seines, each, 2 per cent. The catch by lines consisted principally of yellowfin tuna and skipjack or striped tuna; that by traps almost exclusively sea crawfish or spiny lobster; and that by purse seines principally yellowfin tuna.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—There were 56 persons in 1929 who were engaged in California in transporting the catch of fish. In this trade 1 steam vessel, 7 motor vessels, and 5 sailing vessels, having a combined capacity of 2,325 net tons, were operated.

Wholesale.—There were 61 wholesale establishments along the coast of California engaged primarily in the handling of fresh and frozen products. These establishments employed 812 persons who received \$1,443,138 in salaries and wages.

Manufacturing.—There were 64 establishments in California during 1929 engaged primarily in the manufacture of prepared fishery products or by-products. They employed 6,976 persons who received \$4,670,243 in salaries and wages. The products manufactured, consisting principally of canned sardines, dry-salted cod, and canned tuna and tunalike fishes were valued at \$30,980,699. Detailed statistics of most of the items manufactured may be obtained from Fisheries Document No. 1095 "Fishery Industries of the United States, 1929."

¹ Cod were salted in Alaska waters.

² A standard case contains forty-eight 1-pound cans of sardines and mackerel, or forty-eight ½-pound cans of tuna and tunalike fishes.

³ Includes canned salmon, shad, shad roe, barracuda fish cakes, abalone, squid, and fish for cat and dog food.

⁴ Includes liquid glue, pilchard scales, kelp products, and crushed-shell products.

HISTORICAL REVIEW

Fifteen general surveys have been made for statistics of the fisheries of the Pacific Coast States during the 42 years from 1888 to 1929. The catch for 1888 amounted to 87,043,000 pounds. Since that time the catch has continued to increase, with the largest catch on record shown for 1929, when 1,034,434,000 pounds were taken. Comparative statistics for each of the more important species taken are shown in the following tables:

Fisheries of the Pacific Coast States, 1888 to 1929

SUMMARY: BY STATES

[Expressed in thousands of pounds and thousands of dollars; that is, 000 omitted]

⁵ Less than 500 pounds.

⁶ Consisted mostly of soft clams.

NOTE.—Salt fish have been converted to the equivalent weight of fresh fish.

HALIBUT FISHERY OF THE PACIFIC COAST⁵

The halibut fishery of the Pacific coast, which is prosecuted both by United States (including Alaska) and Canadian vessels, ranks as one of the foremost fisheries of that section. In 1930 the total catch

⁵ To preclude the possibility of unwarranted comparison of figures given in this section with others for years previous to 1927, it should be explained that the figures as herein compiled differ from those published in separate reports for the Alaska fisheries and the Pacific Coast States. The difference lies principally in the fleet classifications as between Washington and Alaska, though there is reason to believe that the figures on landings also are not comparable with those previously published, due to variable practice in the inclusion of United States caught halibut landed at foreign ports as well as the possible duplication of figures. The present compilation is a complete résumé of the landings of the United States fleet for the year 1930 at all Pacific ports except those in Oregon and California, without omission or duplication. The fleet classification has been applied arbitrarily by including in the "Washington fleet" all vessels that land more than half of their catch in that State. All others were included in the "Alaska fleet." It has been necessary to use "hailing fares" for the weight of the landings at Seattle, Wash., and Prince Rupert, British Columbia, although the error therefrom is estimated to be less than 2 per cent. The Alaska data are based on actual weight of the fares. Halibut are landed heads on, but eviscerated.

by vessels of both nationalities amounted to 49,408,000 pounds, valued at \$4,974,000. This is a decrease of 11 per cent in quantity and 26 per cent in value as compared with the catch in 1929. The catch in 1930 was less than in any year during the 5-year period, 1925-1929. Of the total catch in 1930, 83 per cent was taken by United States craft and 17 per cent by Canadian craft. Considered according to ports of landing, 51 per cent was landed at Canadian ports, 26 per cent at ports in the State of Washington, and 23 per cent at ports in Alaska. Prince Rupert, in British Columbia, accounted for the greater part of the Canadian landings due to its excellent rail facilities for transportation eastward and its close proximity to the fishing grounds.

UNITED STATES

Operating units.—In 1930 the halibut fleet of the United States (including Alaska) numbered 221 vessels that fished regularly for halibut. These vessels had a combined capacity of 5,387 net tons. They were manned by 1,435 fishermen and operated 8,049 skates of lines. In addition to the regular vessels, 80 other vessels and 80 boats landed halibut at times. These were manned by 637 fishermen and operated 2,806 skates of lines.

Catch.—The total weight of the catch as landed by all United States craft fishing for halibut amounted to 45,304,549 pounds, valued at \$4,300,688. Of this amount, 90 per cent consisted of halibut, 7 per cent sablefish, 2 per cent "lingcod," and 1 per cent rockfishes. The regular halibut vessels accounted for 89 per cent of the total catch, while the vessels fishing incidentally and boats accounted for the remaining 11 per cent.

Halibut fishery of the Pacific coast, 1930

NOTE.—Statistics for Washington are furnished by the Seattle Halibut Exchange, those for British Columbia by the U. S. Consular Service and the Prince Rupert Halibut Exchange, and those for Alaska by bureau agents.

VESSEL FISHERIES AT SEATTLE, WASH.

During 1930, a total of 38,850,197 pounds of fishery products, valued at \$3,462,304, were handled by Seattle wholesale dealers. This amount is exclusive of quantities received by transporting vessels or rail from Alaska or Canada. This represents a decrease of 2 per cent in quantity and 14 per cent in value as compared with the transactions during the previous year.

Of the total quantity handled, 16,562,185 pounds, valued at \$1,703,083, were landed by fishing vessels, an increase of 2 per cent in quantity and a decrease of 15 per cent in value as compared with the previous year. The vessels made 1,234 trips to the fishing grounds

during the year which is an increase of 106 trips over those in 1929. Halibut was the most important species taken by fishing vessels, accounting for 76 per cent of the catch. Sablefish accounted for 16 per cent; "lingcod," 5 per cent; and rockfishes, 3 per cent.

The catch by fishing vessels was taken off the Pacific coast from Oregon to Unalaska Island. Hecate Straits ranked as the most productive grounds, furnishing 33 per cent of the catch. Second in importance was Cape Flattery, which provided 27 per cent of the catch, while Portlock Bank ranked third, furnishing 10 per cent. The remainder of the catch was taken chiefly from fishing grounds west of longitude 145° W.

Most of the catch by fishing vessels was made during the nine months from March to November, inclusive, which is due to the closed season for taking halibut during the winter months. During the 9-month period of greatest catches, landings averaged about 1,800,000 pounds each month.

During 1930, 22,288,012 pounds of fishery products, valued at \$1,759,221, were received by wholesale dealers from sources other than Alaska or Canada, or from vessels in the halibut fishery discussed above. Most of these were products taken in Puget Sound. This was 5 per cent less than the quantity received from similar sources in 1929 by Seattle wholesale dealers, and the value was 13 per cent less. The decrease in quantity was due to the smaller catch of humpback or pink salmon and consequently smaller quantities handled in the markets as 1930 was the "off" year for this species.

Of the total fishery products handled by wholesale dealers derived from sources other than the halibut fleet or from Alaska or Canada, salmon accounted for 85 per cent, and the remainder was largely crabs, herring, smelt, flounders, "lingcod," sablefish, and steelhead trout. During the six months from May to October inclusive, 84 per cent of the years' transactions of these products were handled.

LAKE FISHERIES⁶

UNITED STATES AND CANADA

In 1929 the total catch of the lake fisheries of the United States and Canada amounted to 114,826,907 pounds. This represents an increase of 24 per cent as compared with the catch in 1928.⁶ Of the total catch, that part taken in the United States amounted to 85,389,-467 pounds, valued at \$6,787,750. This represents 74 per cent of the total catch of the lake fisheries. It is an increase of 35 per cent as compared with the catch in 1928. The Canadian catch, which amounted to 29,437,440 pounds, shows a decrease of less than one-half of 1 per cent as compared with the catch in the previous year.

⁶ The most recent complete statistical canvass made by the bureau for the American catch in the lake fisheries (Lakes Ontario, Erie, Huron, Michigan, Superior, St. Clair, Kabetogama, Namakan, and Sand Point, Lake of the Woods, and Rainy Lake) was for the year 1922. The statistics collected in this canvass are published in condensed form in Bureau of Fisheries Statistical Bulletin No. 618 and in full in the report of the division of fishery industries for 1923.

The statistics of the catch presented herewith for 1929 were obtained mainly from the various State fisheries agencies and Dominion of Canada reports while statistics of the operating units (fishermen, vessels, boats, and gear) actually fished in 1929 were obtained by the bureau in a special canvass. In this latter canvass the catch, segregated as to method of taking, was not ascertained.

The statistics for 1929 are not strictly comparable with those for previous years in every instance as the catch of crawfish and mussels, pearls and slugs taken in mussel-bearing streams tributary to Lake Michigan and Lake Huron was included in the 1929 survey. Similarly, the statistics obtained for Wisconsin for 1929 are not strictly comparable with previous years due to a different and more complete method of collection utilized in 1929.

Statistics in the tables for the years 1913 to 1929 are for Lakes Ontario, Erie, Huron, Michigan, Superior, Namakan, Lake of the Woods, and Rainy Lake. Those for the years 1913 to 1924 were obtained in a survey of the lake fisheries made by the U. S. Tariff Commission, while those for the years 1925 to 1929, inclusive, were compiled and supplemented by the bureau from State statistics. To complete the data for the various lakes there have been included statistics of the Canadian lake fisheries for the years 1913 to 1929, which were obtained from official reports of the Dominion of Canada. The statistics shown for the years 1913 to 1925 are exclusive of the production of Illinois. The disparity resulting from the noninclusion of the production of Illinois is negligible. The production of Indiana from 1913 to 1925 has been estimated. The statistics from 1926 to 1929, inclusive, of the fisheries of these two States were collected by the bureau, which permits of their inclusion with the statistics collected by New York, Pennsylvania, Ohio, Michigan, Wisconsin, and Minnesota.

In all cases the statistics collected are for the calendar year, except for Lake of the Woods, Rainy Lake, and Lake Namakan in Minnesota, which are for two seasons. For Lake of the Woods the seasons are from June 1 to November 1 and December 1 to April 1, and for Rainy and Namakan Lakes from May 15 to November 1 and December 1 to April 1. The catch for these two seasons, in the order named, have been combined to constitute a year. The quantity of fish taken in these lakes between January 1 and April 1 amounted to less than 3 per cent of the total catch of these lakes in 1927.

CATCH

By species.—The statistics of the catch in the United States and Canada in 1929 show that the lake herring ranked first in quantity of production among species of fish taken in the lake fisheries. The catch in 1929 amounted to 25,601,722 pounds, which is 22 per cent of the total production for all the lake fisheries. This represents an increase of 35 per cent as compared with the catch of the previous year. The catch of lake herring in the United States accounted for 82 per cent of the total. Lake trout ranked second in importance with a catch of 17,988,095 pounds and represents 16 per cent of the total production. The catch shows an increase of 14 per cent as compared with that in the previous year. About 66 per cent of the trout were taken in the waters of the United States. Common whitefish ranked third in importance with a catch of 14,572,564 pounds, or 13 per cent of the total. This is an increase of 35 per cent as compared with the catch of the previous year. About 70 per cent of the catch was taken in United States waters. The catch of yellow perch, 58 per cent of which was taken in the waters of the United States, amounted to 13,917,725 pounds. This is an increase of 34 per cent as compared with the catch in 1928. The catch of blue pike, about 53 per cent of which was taken in the waters of the United States, amounted to 5,386,707 pounds. This is a decrease of 23 per cent as compared with the catch in 1928. The catch of cisco in Lake Erie, amounted to only 488,874 pounds in 1929. About 74 per cent of the catch was made in Canadian waters. The catch of this species represents a decrease of 74 per cent as compared with the previous year, and a large decrease as compared with the catches of this fish that were formerly made on Lake Erie.

By lakes.—Statistics of the production in the United States and Canada in 1929, by lakes, show that Lake Michigan ranked as the most important, with a catch of 35,614,571 pounds. This is an increase of 98 per cent as compared with the catch in the previous year. Lake Erie ranked second in importance, the catch amounting to 29,906,772 pounds. This is a decrease of less than one-half of 1 per cent as compared with the catch in the previous year. Lake Superior ranked third, with a catch amounting to 22,004,794 pounds. This is an increase of 19 per cent as compared with the catch in the previous year. The catch of Lake Huron amounted to 17,933,347 pounds, which is an increase of 1 per cent as compared with that in the previous year. The catch in Lake Ontario amounted to 4,638,696 pounds, which is an increase of 4 per cent as compared with the previous year. The catch in Lake of the Woods, Rainy Lake, and Namakan Lake amounted to 4,728,727 pounds, which is an increase of 18 per cent as compared with that in the previous year.

UNITED STATES

OPERATING UNITS

In conducting the survey of the operating units employed in the lake fisheries for 1929 an effort was made to determine the actual number of men, boats, and amount of gear employed in the fisheries. In making this determination only the average number of units of

gear actually fishing simultaneously were counted, and those units being dried on shore, carried on the boats, or held in reserve were disregarded.

Fishermen.—There were 7,159 fishermen employed in the lake fisheries during 1929. Of this number 75 per cent were engaged in the boat and shore fisheries and 25 per cent in the vessel fisheries. Forty-four per cent fished on Lake Michigan, 20 per cent on Lake Erie, 17 per cent on Lake Superior, 14 per cent on Lake Huron, 3 per cent on Lake Ontario, and 2 per cent on Lake of the Woods, Rainy Lake, and Namakan Lake.

Vessels.—During 1929 there were 122 steam vessels and 378 motor vessels engaged in the lake fisheries of the United States. Of this number, 46 per cent of the steam vessels and 70 per cent of the motor vessels were engaged in fishing on Lake Michigan, 26 per cent of the steam vessels and 8 per cent of the motor vessels on Lake Erie, 16 per cent of the steam vessels and 11 per cent of the motor vessels on Lake Huron, 12 per cent of the steam vessels and 10 per cent of the motor vessels on Lake Superior. Only 2 motor vessels were operated on Lake Ontario, and none on the remaining lakes.

Boats.—There were 2,078 motor boats and 1,401 other small boats employed in the lake fisheries during 1929. Of this number, 45 per cent of the motor boats and 34 per cent of the other boats were engaged on Lake Michigan, 19 per cent of the motor boats and 27 per cent of the other boats on Lake Superior, 15 per cent of the motor boats and 21 per cent of the other boats on Lake Erie, 14 per cent of the motor boats and 9 per cent of the other boats on Lake Huron, 4 per cent of the motor boats and 8 per cent of the other boats on Lake Ontario, and 3 per cent of the motor boats and less than one-half of 1 per cent of the other boats on Lake of the Woods, Rainy Lake, and Namakan Lake.

Gill nets.—During 1929 an average number of 108,557 gill nets were used in the lake fisheries. These nets had a total area, as fished, of 27,715,735 square yards, or almost 9 square miles. Of this number, 53 per cent were fished on Lake Michigan, 21 per cent on Lake Erie, 14 per cent on Lake Superior, 9 per cent on Lake Huron, 2 per cent on Lake Ontario, and 1 per cent on Lake of the Woods, Rainy Lake, and Namakan Lake.

Pound nets.—There were 1,694 pound nets used in the lake fisheries during 1929. Of this total, 47 per cent were used on Lake Huron, 40 per cent on Lake Michigan, 5 per cent on Lake Superior, 5 per cent on Lake of the Woods, Rainy Lake, and Namakan Lake, and 3 per cent on Lake Erie.

Trap nets.—There were 6,893 trap nets fished during 1929. Of this number, 65 per cent were fished on Lake Erie, 26 per cent on Lake Huron, 5 per cent on Lake Michigan, 3 per cent on Lake Ontario, and 1 per cent on Lake Superior.

Fyke nets.—There were 2,411 fyke nets fished during 1929. Of this number, 54 per cent were fished on Lake Erie, 25 per cent on Lake Michigan, 12 per cent on Lake Huron, 5 per cent on Lake of the Woods, Rainy Lake, and Namakan Lake, 3 per cent on Lake Ontario, and 1 per cent on Lake Superior.

Hooks.—There were 592,080 hooks fished on the Great Lakes during 1929. This includes 25 trolling hooks used on Lake Superior and 9 on Lake Michigan. Fifty-four per cent of the total number of hooks

were fished on Lake Michigan, 30 per cent on Lake Superior, 12 per cent on Lake Huron, 3 per cent on Lake Ontario, and 1 per cent on Lake Erie.

Seines.—During 1929 there were 290 seines used in the lake fisheries. These had an aggregate length of 159,881 yards. Of the total number, 57 per cent were fished on Lake Erie, 23 per cent on Lake Huron, 18 per cent on Lake Michigan, 1 per cent on Lake Superior, and only 1 seine on Lake Ontario.

CATCH

Michigan, with frontage on Lakes Erie, Huron, Michigan, and Superior, ranked first in importance in the lake fisheries of the United States in 1929. The catch in the waters of this State amounted to 33,373,135 pounds, valued at \$3,248,088. This is 39 per cent of the total catch of the Lakes, produced in the United States, and 48 per cent of the total value. Wisconsin, with fisheries on Lakes Michigan

FIGURE 21.—Yield of principal fishery products in the lake fisheries, 1929

and Superior, ranked second with a catch of 20,163,221 pounds, valued at \$1,539,267. This is 24 per cent of the total catch and 23 per cent of the total value. Ohio, with fisheries only on Lake Erie, ranked third with a catch of 15,823,054 pounds, valued at \$980,703. This represents 18 per cent of the total catch and 15 per cent of the total value. Minnesota was fourth with a catch of 11,470,267 pounds, valued at \$501,747. Minnesota had fisheries on Lake Superior, Lake of the Woods, Rainy Lake, and Namakan Lake, and its catch in these waters amounted to 13 per cent of the total quantity, and 7 per cent of the total value. The catch of fish in New York, which was taken from Lakes Ontario and Erie, amounted to 1,589,898 pounds, valued at \$205,478. This is 2 per cent of the total catch and 3 per cent of the total value. The catch in Pennsylvania, taken exclusively in Lake Erie, amounted to 1,342,755 pounds, valued at \$163,336. This is 2 per cent of the total catch and 2 per cent of the total value. The catch in Indiana amounted to 1,015,850 pounds, valued at \$72,796. This is 1 per cent of the total catch and 1 per cent of the total value. The catch in Illinois amounted to 611,287 pounds, valued at \$76,335. This is 1 per cent of the total catch and 1 per cent of the total value.

Crawfish pots, fished by boats ¹²		4,666		4,666			
Crowfoot bars ¹³		25		25			
Forks ¹³		22		22			

¹ Used principally for taking carp, pike, perch, and suckers.

² Used principally for taking chubs, herring, perch, and Menominees. Michigan prescribes 2¾ to 2¾ inches, and Indiana 2½ to 2¾ inches for chubs, perch, pilot or Menominees, and other rough fish. Indiana prescribes 2¾ inches for herring, while Michigan prescribes 2¾ to 2¾ inches, except that 2½ inches may be used from Nov. 1 to Dec. 15 under certain restrictions as to depth, and 2¼ inches from Jan. 1 to Apr. 1 under the ice when bottom of net is not less than 20 feet from bottom of lake or bay. Illinois prescribes 2¾-inch mesh for herring and 2½ to 2¾ inches for chubs. Wisconsin prescribes 2¾ to 2¾ inches for herring, chubs, perch, and other rough fish in Lake Michigan and 2¾ inches in Green Bay. In Green Bay 2¾-inch mesh may be used for herring, chubs, perch, and other rough fish from Dec. 1 until the ice goes out, and is to be fished under and hung to ice. In Lake Superior, Wisconsin prescribes 2¾ inches for herring during November to December. In Minnesota 2¾ inches may be used for herring but 2½ inches for chubs in not less than 60 fathoms.

³ 3-inch mesh is permitted by New York only, on both Lake Erie and Lake Ontario for both shoal and bull nets and can take any species except whitefish, lake trout, and sturgeon. Pennsylvania and Ohio prescribe a 3¼-inch mesh for both shoal and bull nets for all species except whitefish in Ohio and lake trout in Pennsylvania.

⁴ Used principally for taking whitefish, trout, pike, and suckers. No 4½-inch mesh is permitted on Lakes Ontario and Erie, except in the State of Michigan, where none is used. Michigan, Indiana, Illinois, and Minnesota prescribe 4½-inch mesh for whitefish and trout. Wisconsin is the only State that permits 4-inch mesh for these species.

⁵ 3-inch mesh is permitted by New York only, on both Lake Erie and Lake Ontario for both shoal and bull nets and can take any species except whitefish, lake trout, and sturgeon. Pennsylvania and Ohio prescribe a 3¼-inch mesh for both shoal and bull nets for all species except whitefish in Ohio and lake trout in Pennsylvania.

⁶ Used principally for taking whitefish, trout, and suckers. No 4½-inch is permitted on Lakes Ontario and Erie, except in the State of Michigan, where none is used.

⁷ Used principally for taking sturgeon.

⁸ Used principally for taking carp.

⁹ Used principally for taking trout.

¹⁰ Used for taking miscellaneous fish.

¹¹ Used principally for taking minnows.

¹² Used for taking crawfish.

¹³ Used for taking mussels.

INDUSTRIES RELATED TO THE FISHERIES

Transporting.—There were 77 persons in the Lake States engaged in the transporting of fish during 1929. In this trade 3 steam vessels and 30 motor vessels having a combined capacity of 584 net tons were operated.

Wholesale.—There were 151 wholesale establishments in the Lake States engaged primarily in handling fresh and frozen fishery products. These establishments employed 1,352 persons who received \$2,468,520 in salaries and wages.

Manufacturing.—There were 33 establishments in the Lake States during 1929 engaged primarily in the manufacture of prepared fishery products or by-products. They employed 253 persons who received \$277,146 in salaries and wages. The products manufactured, consisting principally of smoked, salted, and spiced fishery products, were valued at \$1,817,054. In addition to the above, fishermen prepared products, mostly salted lake herring, valued at \$211,671. Detailed statistics of most of the items manufactured may be obtained from Fisheries Document No. 1095, "Fishery Industries of the United States, 1929."

HISTORICAL REVIEW

Statistics of the catch of fishery products in the United States waters of the Great Lakes are available for various years from 1885 to 1908, inclusive, and for all the years from 1913 to 1929, inclusive. During these periods the catch has been marked by many fluctuations, reaching a peak in 1890 when the catch amounted to 113,899,000 pounds and registered the smallest catch on record in 1928 when 63,368,000 pounds were taken. In 1929 the catch amounted to 85,389,000 pounds.

Since 1913 records of the catch in the Canadian waters of the Great Lakes are available as well as those for the United States. During the 5-year period from 1916 to 1920, inclusive, an average catch of 129,162,000 pounds was registered for the Lakes, while that in 1929 amounted to 115,037,000 pounds. Comparative statistics for each of the species taken in the United States and Canada since 1913 are shown in the following tables:

Lake fisheries of the United States, 1885-1929

¹ The Canadian catch of these species has been included with "Miscellaneous fish."² The catch for Lake Huron was included with "Miscellaneous fish" prior to 1919.³ The catch for the United States was included with other classifications prior to 1925.⁴ Included with "Miscellaneous fish" prior to 1928.

MUSSEL-SHELL INDUSTRY OF THE LAKE FISHERIES

Statistics of the mussel-shell industry of the lake fisheries were obtained for the year 1929 for the first time since they were collected as a part of the complete survey of the Great Lakes for 1922. The mussel-shell industry employed 988 fishermen during 1929 as compared with 563 in 1922. The value of the catch of mussel shells and pearls and slugs amounted to \$349,647, which is an increase of 50 per cent as compared with the value of the catch in 1922. The catch of mussel shells amounted to 7,414,521 pounds, valued at \$328,782, which is an increase of 19 per cent in the catch and 51 per cent in the value of the catch as compared with the catch and its value in 1922. The value of the catch of pearls and slugs was \$20,865, which is an increase of 33 per cent as compared with the value in 1922. Considered according to value, mussel shells were by far the most important product, accounting for 94 per cent of the total value of the catch.

OPERATING UNITS

The catch of fishery products in the mussel-shell industry of the lake fisheries was taken by 988 fishermen, 545 motor boats, 261 other small boats, 689 pairs of crowfoot bars, 110 tongs, 422 forks, 10 rakes, and 234 picks.

The 10 rivers tributary to Lake Michigan accounted for over 99 per cent of the total number of fishermen employed and for over 99 per cent of the boats operated. The single river tributary to Lake Huron accounted for the remainder.

Grand River accounted for 51 per cent of the total number of fishermen employed and for 50 per cent of the boats operated. St. Joseph River accounted for 25 per cent of the fishermen and 26 per cent of the boats. Muskegon River accounted for 10 per cent of the fishermen and 7 per cent of the boats. All these rivers are tributary to Lake Michigan.

Michigan accounted for 87 per cent of the total number of fishermen employed and for 85 per cent of the boats operated. Indiana accounted for 10 per cent of the fishermen and 11 per cent of the boats, and Wisconsin accounted for 3 per cent of the fishermen and for 4 per cent of the boats.

CATCH

Three types of gear accounted for 95 per cent of the fishery products taken in the mussel-shell industry of the Lake fisheries during 1929. By far the most important of these gears were crowfoot bars, which accounted for 67 per cent of the catch and 67 per cent of the value of the catch. Ranked next in order were forks, which accounted for 18 per cent of the catch and 18 per cent of the value of the catch. Picks were third, accounting for 10 per cent of the catch and 10 per cent of the value of the catch.

The 10 rivers tributary to Lake Michigan accounted for 99 per cent of the catch and 99 per cent of the value of the catch. The single river tributary to Lake Huron accounted for the remainder.

Grand River accounted for 54 per cent of the total catch and 55 per cent of the total value. St. Joseph River accounted for 19 per cent of the catch and 19 per cent of the value. Muskegon River accounted

for 11 per cent of the catch and 11 per cent of the value. All these rivers are tributary to Lake Michigan.

The fisheries of the mussel-shell industry were prosecuted in 4 rivers in Michigan, 4 in Wisconsin, 2 in Indiana, and 1 in both Michigan and Indiana. Michigan accounted for 88 per cent of the total catch and 91 per cent of the total value. Indiana accounted for 7 per cent of the catch and 6 per cent of the value, and Wisconsin accounted for 5 per cent of the catch and 3 per cent of the value.

BUTTON BLANK MANUFACTURING

There were four establishments in the mussel-shell industry of the Lake fisheries engaged in the manufacture of mussel-shell products during 1929. They employed 42 persons, who received \$37,218 in salaries and wages. The products manufactured consisted of button blanks, valued at \$47,669, and miscellaneous products, valued at \$1,125.

FISHERIES OF THE MISSISSIPPI RIVER AND TRIBUTARIES

The latest statistical canvass made of the fisheries and fishery industries of the Mississippi River and tributaries was for the calendar year 1922. The complete statistics for the canvass were published in the report of the division of fishery industries for 1923 and in Statistical Bulletin No. 607. During 1922 the fisheries and fishery industries of this region employed 19,122 persons, and the yield of the fisheries amounted to 105,733,734 pounds, valued at \$4,503,521.

Of the total catch in 1922 by far the most important product was fresh-water mussel shells which alone amounted to 51,768,173 pounds, valued at \$1,050,592. This represents 49 per cent of the total weight and 23 per cent of the total value of the catch. A survey of the fresh-water mussel-shell fishery for 1929 shows a production of 46,937,479 pounds, valued at \$996,137, for the Mississippi River and tributaries.

FRESH-WATER MUSSEL-SHELL FISHERY

During 1930 the catch of fresh-water mussel shells in the United States amounted to 59,490,000 pounds, valued at \$1,092,156. This represents an increase of 9 per cent in quantity but a decrease of 18 per cent in value, as compared with the catch and its value in 1929.

Arkansas was the most important producing State during 1930, accounting for 31 per cent of the total catch. Illinois ranked second with 14 per cent. Other important producing States were Tennessee, 13 per cent; Indiana, 9 per cent; Michigan, 8 per cent; Iowa, 6 per cent; Kentucky, 4 per cent; and Alabama and Wisconsin, each, 3 per cent.

LAKE PEPIN

The fisheries of Lake Pepin, exclusive of those prosecuted for mussel shells, employed 111 fishermen in 1930 as compared with 54 in 1929. The catch amounted to 388,010 pounds, valued at \$23,055—a decrease of 1 per cent in the catch and 27 per cent in the value of the catch as compared with the catch and its value for 1929. Compared with 1922, there was a decrease of 89 per cent in the catch. German carp was by far the most important species taken in this lake, constituting 67 per cent of the total catch and 56 per cent of the value of the catch. Fresh-water drum or sheepshead was second in importance, accounting for 16 per cent of the catch and 19 per cent of the value. Other species of considerable importance were catfish and bullheads, and buffalofish.

OPERATING UNITS BY GEAR

In 1930 the catch of fishery products of Lake Pepin was taken by 39 regular fishermen, 72 casual fishermen, 41 motor boats, 87 other small boats, 18 haul seines having a combined length of 11,433 yards, 7 gill nets having a combined length of 5,300 yards, 1 line with 300 hooks, 106 pound nets, 76 fyke nets, and 3 spears.

CATCH BY GEAR

Two types of gear accounted for 92 per cent of the catch of fishery products taken in this lake during 1930. By far the most important of these were haul seines, which accounted for 65 per cent of the catch and 57 per cent of the value of the catch. Ranked next in importance were pound nets, which accounted for 27 per cent of the catch and 36 per cent of the value of the catch.

OPERATING UNITS BY STATES AND COUNTIES

Wisconsin accounted for 93 per cent of the total number of fishermen employed in the fisheries of Lake Pepin during 1930. Pepin County, Wis., ranked foremost in this respect, accounting for 60 per cent. Wisconsin also accounted for 94 per cent of the fishing boats. Pepin County, Wis., alone accounted for 52 per cent.

CATCH BY STATES AND COUNTIES

The fisheries of Lake Pepin were prosecuted in two counties in Minnesota and two in Wisconsin during 1930. Pepin County, Wis., accounted for 40 per cent of the total catch and 48 per cent of the value of the catch. Pierce County, in the same State, accounted for 46 per cent of the total catch and 40 per cent of the value.

LAKE KEOKUK

The fisheries of Lake Keokuk, exclusive of those for mussel shells, employed 62 fishermen during 1930 as compared with 55 in 1929. The catch amounted to 241,710 pounds, valued at \$20,251, which is a decrease of 31 per cent in the catch and 21 per cent in the value of the catch as compared with the catch and its value for 1929. Compared with 1922, there has been a decrease of 66 per cent in the catch. Considered according to the value of the catch, catfish and bullheads were by far the most important fish taken, accounting for 24 per cent of the catch and 56 per cent of the value of the catch. German carp ranked next with 51 per cent of the catch and 25 per cent of the value of the catch. Fresh-water drum or sheephead ranked third with 15 per cent of the catch and 12 per cent of the value of the catch. Buffalofish, the only other species of importance, accounted for 10 per cent of the catch and 7 per cent of the value of the catch.

OPERATING UNITS BY GEAR

The catch of fishery products of Lake Keokuk was taken by 26 regular fishermen, 36 casual fishermen, 33 motor boats, 58 other small boats, 8 haul seines having a combined length of 2,198 yards, 10 lines with 6,200 hooks, 877 fyke nets, and 195 baskets.

CATCH BY GEAR

Three types of gear accounted for 92 per cent of the catch of fishery products taken in this lake during 1930. By far the most important of these gears were fyke nets, which accounted for 66 per cent of the

catch and 68 per cent of the value of the catch. Ranked next in order were haul seines, which accounted for 13 per cent of the catch and 8 per cent of the value, while baskets accounted for 13 per cent of the catch also and 17 per cent of the value.

OPERATING UNITS BY STATES AND COUNTIES

Iowa accounted for 69 per cent of the total number of fishermen employed in the fisheries of Lake Keokuk. Des Moines County, Iowa, accounted for 60 per cent of the total number of fishermen. The entire activities in Illinois were confined to Hancock County, which accounted for 31 per cent of the total number of fishermen. Des Moines County, Iowa, accounted for 58 per cent of the boats operated. Hancock County, Ill., accounted for 32 per cent.

CATCH BY STATES AND COUNTIES

The fisheries of Lake Keokuk were prosecuted in one county in Illinois and two in Iowa during 1930. Hancock County, Ill., accounted for 49 per cent of the catch and 60 per cent of the value of the catch, and Des Moines County, Iowa, accounted for 37 per cent of the catch and 27 per cent of the value of the catch.

MISSISSIPPI RIVER BETWEEN LAKES PEPIN AND KEOKUK

Statistics of the fisheries of the Mississippi River between Lakes Pepin and Keokuk were obtained for the year 1930 for the second time since they were collected as a part of the complete survey of the Mississippi River and tributaries for 1922. These two surveys have been made, as were those for Lakes Pepin and Keokuk, primarily to determine the biological and economic effects on the fisheries of this section following the construction of the Keokuk Dam; also, to forecast the probable effects of any subsequently constructed dams in this region.

The fisheries of the Mississippi River between Lakes Pepin and Keokuk, exclusive of those for mussel shells, employed 607 fishermen during 1930 as compared with 675 in 1929. The catch amounted to 3,539,760 pounds, valued at \$252,184, which is an increase of 13 per cent in the catch and 10 per cent in the value of the catch as compared with the catch and its value for 1929.

Considered according to the value of the catch, German carp was the most important fish taken, accounting for 46 per cent of the total catch and 35 per cent of the value of the catch. Buffalofish ranked next, accounting for 24 per cent of the catch and 27 per cent of the value of the catch, and catfish and bullheads third, accounting for 11 per cent of the catch and 24 per cent of the value. Other species of importance were fresh-water drum or sheepshead, suckers, and bowfin.

OPERATING UNITS BY GEAR

The catch of fishery products in the Mississippi River between Lakes Pepin and Keokuk was taken by 308 regular fishermen, 299 casual fishermen, 271 motor boats, 479 other small boats, 219 haul seines having a combined length of 38,451 yards, 15 gill nets having a combined length of 2,616 yards, 151 lines with 44,000 hooks, 8 trammel nets having a combined length of 1,600 yards, 3,515 fyke nets, 301 pound nets, and 609 baskets.

CATCH BY GEAR

Two types of gear accounted for 92 per cent of the catch of fishery products taken in this region during 1930. First in importance were haul seines, which accounted for 66 per cent of the catch and 59 per cent of the value of the catch. Fyke nets ranked next, accounting for 26 per cent of the catch and 30 per cent of the value of the catch.

OPERATING UNITS BY STATES

Iowa ranked foremost in the number of persons fishing in that part of the Mississippi River between Lakes Pepin and Keokuk, accounting for 40 per cent of the total; Wisconsin ranked second with 32 per cent; Minnesota, third, with 20 per cent; and Illinois fourth, with 8 per cent. Iowa also ranked first in the number of fishing boats, accounting for 43 per cent of the total. Wisconsin followed with 30 per cent.

CATCH BY STATES AND COUNTIES

The fisheries of the Mississippi River between Lakes Pepin and Keokuk were prosecuted in 6 counties in Illinois, 8 in Iowa, 3 in Minnesota, and 6 in Wisconsin. The fisheries of Iowa accounted for

48 per cent of the total catch and 50 per cent of the total value of the catch, and those in Wisconsin accounted for 27 per cent of the catch and 25 per cent of the value. Allamakee County, Iowa, was the most important county, accounting for 21 per cent of the catch and 21 per cent of the value of the catch.

FISHERIES OF ALASKA

Statistics for the fisheries of Alaska are collected and compiled by the Alaska division of the bureau. A summary of these statistics appears herewith. For the detailed figures the reader is referred to Alaska Fishery and Fur-Seal Industries in 1930, by Ward T. Bower, Appendix I to the report of the United States Commissioner of Fisheries for 1931.

The fisheries of Alaska during 1930 employed 27,568 persons, of whom 10,189 were fishermen, 15,453 were engaged in the wholesale and manufacturing industries, and 1,926 in transporting fishery products. The catch in round weight, exclusive of whales, amounted to 611,285,108 pounds, valued at \$12,285,313. The round weight of whales could not be determined, but their products amounted to 9,416,475 pounds, valued at \$470,265. Of the total catch, exclusive of whales, 426,441,857 pounds, valued at \$8,040,786, consisted of salmon; 182,863,624 pounds, valued at \$4,136,351, consisted of other fish; and 1,979,627 pounds, valued at \$108,176, consisted of shellfish.

FIGURE 23.—Yield of principal fishery products in Alaska, 1930

There were 260 establishments (exclusive of duplication) engaged in the fisheries trade in Alaska in 1930. Of these, 153 canned fish, 95 cured fish, 24 manufactured by-products, and 46 handled fresh and frozen fishery products.

The output of these establishments amounted to 370,564,027 pounds, valued at \$37,679,049. The salmon industry was by far the most important and produced 259,143,338 pounds of products, valued at \$31,532,488. In value, the halibut industry was next in importance and produced 31,557,084 pounds of products, valued at \$2,991,400. The herring industry ranked third and produced 68,144,048 pounds of products, valued at \$2,133,677. Of the remainder, whale, clam, and shrimp products were most important in value.

In considering the wholesale and manufacturing industries separately, the canning industry ranked foremost and produced 242,041,911 pounds of fishery products, valued at \$29,943,681. In value, fresh fish ranked second, producing 27,296,445 pounds of products, valued at \$2,669,796. The by-products industry was third, with products amounting to 62,121,168 pounds, valued at \$2,063,527; the cured-fish industry was fourth, with an output of 16,023,188 pounds, valued at \$1,604,153; and the frozen-fish industry fifth, accounting for the remainder of the products, amounting to 23,081,315 pounds, valued at \$1,397,892.

FISHERIES OF THE VIRGIN ISLANDS OF THE UNITED STATES

During 1930, the fisheries of the Virgin Islands of the United States employed 405 fishermen. Their catch amounted to 616,000 pounds of fishery products valued at \$49,080 to the fishermen. In making the catch, the fishermen used 1 motor boat, 38 sail boats, and 147 row boats. The gear employed consisted of 40 haul seines, 90 tangle nets (turtle), 113 cast nets, 297 lines, and 1,600 set pots.

As the fishermen keep no records of their operations, it was impossible to separate the catch by species. In general, it may be stated that about one-third of the total catch was made by set pots, one-third by seines, and one-third by lines or other types of gear, and by hand.

COMMON AND SCIENTIFIC NAMES OF FISHERY PRODUCTS

In order to prevent misunderstanding from the use of common names employed in the tables and discussions, the following list of common and scientific names is given.

Common and scientific names of the commercial fishery products caught in the United States and Alaska

Common name as shown in bureau reports	Other common names	Scientific names
Albacore.....	Longfin tuna.....	<i>Germo alalunga</i> .
Alewives.....	Branch herring, wall-eyed or big-eyed herring. Blueback, glut herring.....	<i>Pomolobus pseudoharengus</i> .
Amberjack.....		<i>Pomolobus xestivalis</i> .
Anchovies.....		<i>Seriola</i> sp. <i>Engraulis mordax</i> .
Angelfish.....		<i>Anchoviella delicatissima</i> .
Barracuda.....		<i>Anchoviella compressa</i> .
Black bass.....	Smallmouth bass.....	<i>Pomacanthus arcuatus</i> .
Bluefish.....	Largemouth bass.....	<i>Angelichthys isabelita</i> .
Blue pike.....	Tailor.....	<i>Sphyræna argentea</i> (Pacific coast).
Blue runner or hardtail.....	Pike perch, blue pickerel (Canada).....	<i>Sphyræna barracuda</i> (Atlantic coast).
Bonito.....	Runner.....	<i>Micropterus dolomieu</i> .
Bowfin.....		<i>Micropterus salmoides</i> .
Buffalofish.....		<i>Pomatomus saltatrix</i> .
Bullhead.....		<i>Stizostedion glaucum</i> .
Butterfish.....	Dollarfish.....	<i>Caranx crysos</i> .
Burbot.....	Lawyer, ling.....	<i>Sarda sarda</i> .
Cabio.....	Coal-fish, crab eater, cobia.....	<i>Sarda chiliensis</i> .
Carp (German).....		<i>Amia calva</i> .
Catfish.....		<i>Ictiobus</i> sp.
Cero.....		<i>Ameiurus</i> sp.
Chubs.....	Tullibee in Canada; longjaws, bluefin, blackfin in United States.	<i>Poronotus triacanthus</i> .
Cisco.....	Herring in Canada.....	<i>Lota maculosa</i> .
Cod.....	Codfish.....	<i>Rachycentron canadum</i> .
Cowfish.....	Trunkfish, chapin.....	<i>Cyprinus carpio</i> .
Crappie.....	White crappie.....	<i>Siluridæ</i> sp.
Crevalle.....	Black crappie, strawberry bass, calico bass.....	<i>Scomberomonus regalis</i> .
Croaker.....		All <i>Leucichthys</i> except <i>artedi</i> (in Great Lakes).
Cunner.....		<i>Leucichthys artedi</i> (Lake Erie only).
Cusk.....		<i>Gadus macrocephalus</i> (Pacific coast).
		<i>Gadus callarias</i> (Atlantic coast).
		<i>Ostracion</i> sp.
		<i>Pomozis annularis</i> .
		<i>Pomozis sparoides</i> .
		<i>Caranx hippos</i> .
		<i>Micropogon undulatus</i> .
		<i>Tautoglabrus adspersus</i> .
		<i>Brosmius brosme</i> .

		<i>Cucumaris frondosa</i> ; <i>Thyone briareus</i> .

STATISTICAL SURVEY PROCEDURE

METHODS OF COLLECTION

In order that persons using the statistics in this report may judge as to their completeness and authenticity, there follows an outline of the methods employed by the bureau in collecting fishery statistics. It will be noted that several methods are used. Each, in so far as possible, is the most efficient that can be developed to accomplish the desired result with the available personnel.

General fishery statistics.—The purpose of collecting general fishery statistics is to obtain statistics on the catch of fishery products and its value as landed by the fishermen, the quantity or number of each kind of gear used, the number of fishing boats, the number and net tonnage of fishing and transporting vessels, the number of wholesale establishments, the amount of wages and salaries paid in these establishments, the quantity and value of products prepared, and the number of persons engaged in each phase of the industry.

The scope of the coastal surveys includes the commercial fisheries of the oceans, bays, and coastal rivers as far inland as commercial fishing is important. This usually coincides with the range of commercial fishing for anadromous species. Statistics of the fisheries of the Mississippi River include the fisheries of the Mississippi River proper, as well as all tributaries wherein commercial fishing for either fish, crustaceans, or mollusks is prosecuted. Statistics of the lake fisheries include those prosecuted in the Great Lakes, adjacent bays, and the international lakes of northern Minnesota, as well as certain rivers having outlets into these waters.

General statistics of the fisheries for all sections of the United States have not been collected on an annual basis, although the data for 1929 include all the commercial fisheries of the marine and lake sections and the fresh-water mussel fishery of the Mississippi River and tributaries.

In conducting these surveys it is the custom of the bureau to dispatch agents to the districts to be surveyed early in the calendar year. They obtain statistics on operations during the previous calendar year, except that statistics of the oyster fishery are obtained for the season ending in the spring of the following year. The agents conducting these surveys are trained men or recruits working under the close supervision of trained men. Recruits are permitted to work individually only after proving a satisfactory aptitude for the work during their training period. While it is impossible for the few agents available to interview each fisherman in a given locality, the more important ones are visited and a sufficient number of those of lesser importance are interviewed to obtain reliable information on their production. In practice, virtually all wholesale firms are visited, as well as captains of fishing vessels (those of 5 net tons or over) and also all the more important shore fishermen and representative small producers.

As an aid in locating fishermen, lists of vessel and motor-boat owners are obtained from local customs houses. It is also often possible to obtain the names of licensed commercial fishermen and occasionally some statistics of the catch from the various State fishery agencies. In the Great Lakes and Pacific Coast States such

exceptional cooperation has been obtained from the State agencies in recent years that only fragmentary surveys are made by the bureau to supplement missing data. Virginia has recently adopted a very complete statistical plan.

For the Great Lakes and international lakes of northern Minnesota the bureau obtains catch statistics and usually the value of the catch direct from the State records. To obtain data on the fishermen, boats, vessels, and gear the bureau conducts such personal surveys among the fishermen as may be necessary to supplement the State records. Annual catch statistics are available since 1913.

Agents are stationed at Seattle, Wash., who survey each of the Pacific Coast States annually to supplement data that are missing from the State records. In most cases the value of the catch is derived from dealers' records and from estimates of prices. In Washington and Oregon the offshore fisheries are surveyed separately for units of operation, catch, and value of the catch. In almost all other respects the statistics are as collected by the States. Statistics of the wholesale industry for this section are obtained largely by personal interview.

The fisheries of Alaska are conducted primarily by large operators. Sworn statements are required from these operators concerning their operations. These are collected and compiled by the Alaska division of this bureau. Bulletins containing statistics for each district are released following the survey.

Landings at certain important United States ports.—Statistics of the landings at the principal New England ports—Boston and Gloucester, Mass., and Portland, Me.—are similarly obtained. An agent is permanently stationed at each of these ports. His duties include the obtaining of statistics on the quantity of fish landed each day by each fishing vessel, the value of such fish landed, information concerning the date of departure and arrival of the vessel, and also a list of the grounds from which the fish were taken and the gear used in their capture. These statistics are forwarded to the bureau, where compilations are made. Monthly statistical bulletins are issued for these landings as well as annual bulletins summarizing the year's activities.

Statistics of the landings of fish at Seattle, Wash., are collected by the bureau's agent at that place. Landings are classified as those made by American fishing vessels and those received by Seattle wholesale dealers. The landings credited to United States fishing vessels are made by vessels operating distinctly as primary fishing units, usually in the offshore fisheries, while those credited as received by wholesale dealers are usually products of the shore fisheries collected mainly from points in Puget Sound and do not include fish received from Alaska or Canada, or landings made by the halibut fleet. Monthly statistical bulletins are issued for these landings as well as annual bulletins summarizing the year's activities.

Statistics of the combined landings of fish at New York City and Groton, Conn., are obtained by J. H. Matthews, executive secretary of the United States Fisheries Association. Statements of these landings are forwarded to the bureau, where they are compiled. These statistics have not included the value of the catch. Monthly bulletins including these data are not issued; however, a summary is published in this document.

Statistics of the fishery products handled at the municipal wharf, Washington, D. C., are reported to the bureau daily by agents of the city health department. These are compiled on an annual basis. They are not published in bulletin form, but a summary of the year's activities is published in the annual report of this division.

Atlantic mackerel fishery.—Complete statistics on the catch by the Atlantic mackerel fleet are obtained by combining the figures of mackerel landed at Boston and Gloucester, Mass., and Portland, Me., with those obtained by agents who in recent years have been stationed at other Atlantic ports where mackerel are landed. These agents obtain data on each fare of mackerel landed, similar to the data obtained on the landings by fishing vessels at the three New England ports. Complete statistics of this fishery appear only in the annual reports of this division, although the landings at the principal New England ports appear in the monthly and annual bulletins published for those ports.

Shad and alewife fisheries.—Due to the importance of the Hudson and Potomac Rivers in the production of shad, surveys for statistics of the catch, value of the catch, and operating units are made annually. On the Potomac River similar statistics also are obtained for the alewife fishery. The surveys are conducted by agents in a manner similar to that employed in the collection of general fishery statistics, except that probably more fishermen are interviewed as great care is exercised to make these canvasses as accurate as possible.

The State of New York obtains statistics for the fisheries of the Hudson River that closely parallel those desired by the bureau for this fishery, which alleviates the work on this river. Both Maryland and Virginia issue licenses for fishing, which give a very satisfactory list of fishermen for the agents surveying the Potomac River.

Statistics of the shad and alewife fisheries are not published separately in bulletin form, but a summary of the year's activities is published in the annual report of this division.

Sponge market, Tarpon Springs.—A large proportion of the total output of sponges in Florida is handled through the sponge exchange at Tarpon Springs. In view of this, the bureau has arranged with a representative of the exchange to furnish statistics of the quantity and value of the sponges, by variety classification, handled through it annually. Statistics of the quantity of sponges handled through the exchange are not published in bulletin form, but a summary of the year's activities is published in the annual reports of this division.

Fisheries of Lakes Pepin and Keokuk.—As a means of ascertaining the effect of the Keokuk Dam upon the fisheries of the upper Mississippi River, annual statistics of the fisheries of Lakes Pepin and Keokuk are obtained by personal surveys conducted by employees of the bureau at the Fairport (Iowa) biological station and the La Crosse (Wis.) fish-cultural station. Their methods are like those employed in the general surveys. The statistics are not published in bulletin form, but summaries of production appear in the annual reports of this division.

Fisheries of the Mississippi River.—Statistics on that portion of the Mississippi River lying between Lakes Keokuk and Pepin are collected as a part of the survey for the two lakes. Statistics covering this production are not available in bulletin form but a summary appears in this report.

Annual surveys for statistics of the production of fresh-water mussel shells are made by questionnaire supplemented by personal canvass. A summary of the production appears in this report.

Pacific halibut fishery.—Statistics of the Pacific halibut fishery are obtained by the bureau's agent in Seattle, aided by bureau representatives in Alaska, American consuls in British Columbia and the International Halibut Commission. The fleet classification has been arbitrarily applied by including in the "Washington fleet" all vessels that land more than half of their catch in that State. All other American vessels of the halibut fleet are included in the Alaska fleet. Monthly and annual statistical bulletins are available on this fishery, being published along with the statistics of the landings of fishery products at Seattle, Wash.

Canned fishery products and by-products trade.—Beginning in 1921, the bureau has made annual surveys for statistics of the canned fishery products and by-products industries. These are begun the first week in January of each year for statistics of the production in the preceding year. The surveys occupy usually 6 to 9 weeks' time. During this period agents visit each plant in the United States where there is a production of canned fishery products or by-products. They obtain statistics of the production and value of the production for each commodity. In rare instances, where plants are not easily reached by regular transportation facilities, returns are obtained by mail.

Statistics on the production of marine pearl-shell products were included in this survey for the first time in the data for 1930.

The value shown for canned products constitutes the gross amount received by the packer at the production point, no deductions being made for commissions or expenses.

Statistics of the canned fishery products and by-products produced in Alaska are received on the same sworn statements that include statistics of the general fisheries. An annual statistical bulletin is issued on this trade.

Cured fishery products trade.—Statistics of the products of this trade are collected as part of the surveys for general fishery statistics. A bulletin showing this production was issued for the year 1929.

Packaged-fish trade.—Complete statistics of the annual production and value of fish packaged in the United States are obtained as a part of the survey for statistics of the canned fishery products and by-products industries. These statistics are published in bulletin form annually.

Cold-storage holdings of fish.—An arrangement has been made with the Bureau of Agricultural Economics, Department of Agriculture, whereby statistics of the cold-storage holdings of the various species of fish, by sections of the United States, are furnished to this bureau monthly. Included with statistics of the holdings is a statement of the quantity of the various species of fish frozen and also the holdings of cured fish. Bulletins showing these statistics are issued monthly as well as annually.

Foreign fishery trade.—Statistics on the foreign fishery trade are obtained from compilations made by the Bureau of Foreign and Domestic Commerce. Statistics of all known fishery products imported or exported are assembled in one table and published annually in the report of this division.

COMPILATION PRACTICES

Certain practices of importance used in the compilation of fishery statistics are explained below:

Days absent.—In computing "days absent" for vessels landing fares at the various ports, the day of departure and the day of arrival are included; thus, a vessel leaving port on the 8th of the month and returning on the 15th of the month will be shown as being absent eight days.

Operating units.—Operating units as referred to in this document include persons engaged and fishing craft and gear employed.

Vessels.—The term "vessels" refers to craft having a capacity of 5 net tons or greater.

Incidental catch.—The term "incidental catch" refers to the catch of certain species by a type of gear which ordinarily does take appreciable amounts, if any, of such species.

Percentages.—Percentages are usually shown as whole numbers. Fractions of per cents are dropped if less than five-tenths, and the percentage is raised to the next higher integer if the fraction is greater than five-tenths. If the fraction is exactly five-tenths, the integer is raised or lowered to make it an even number.

Converting.—Many of the figures shown in the statistical tables published herewith have been reduced to thousands of pounds or dollars. In making these conversions the largest number from which a group of items is computed is raised or lowered to the nearest thousands place. If the number ends in an even 500, the thousands integer is raised or lowered to make it an even number. The individual items are changed to conform to the total thus obtained.

Conversion factors.—The principal conversion factors that have been used in this report are as follows:

Alewives	To convert number of fish to weight in pounds multiply by 0.4.
Clams, hard.....	To convert bushels to pounds of meat multiply by 8.
Clams, soft	To convert bushels to pounds of meat multiply by 10.
Cod, large, salted.....	To convert to fresh-gutted weight multiply by 1.90.
Cod, market, salted.....	To convert to fresh-gutted weight multiply by 1.94.
Cod, scrod, salted.....	To convert to fresh-gutted weight multiply by 1.98.
Cod, all sizes, fresh gutted.....	To convert to round weight multiply by 1.25.
Crabs, blue (hard and soft).....	To convert number of crabs to weight in pounds multiply by 0.333.
Cusk, salted.....	To convert to fresh-gutted weight multiply by 1.90.
Haddock, large, salted.....	To convert to fresh-gutted weight multiply by 2.06.
Haddock, scrod, salted.....	To convert to fresh-gutted weight multiply by 2.10.
Haddock, fresh-gutted, all sizes ..	To convert to round weight multiply by 1.25.
Hake, large, salted.....	To convert to fresh-gutted weight multiply by 1.90.
Hake, small, salted.....	To convert to fresh-gutted weight multiply by 1.98.
Halibut, salted.....	To convert to fresh-gutted weight multiply by 2.
Herring, salted.....	To convert to round weight multiply by 1.50.
Mackerel, salted.....	To convert to round weight multiply by 1.35.

Menhaden.....	To convert number of fish to weight in pounds multiply by 0.6.
Oysters.....	To convert bushels to pounds of meat multiply by 7.
Oil (east coast).....	To convert gallons to pounds multiply by 7.5.
Oil (west coast).....	To convert gallons to pounds multiply by 7.74.
Pollock, salted.....	To convert to fresh-gutted weight multiply by 1.90.
Scallops.....	To convert bushels to pounds of meat multiply by 6.
Sponges, dried (Florida):	
Large wool.....	To convert number of sponges to weight in pounds multiply by 2.5.
Small wool.....	To convert number of sponges to weight in pounds multiply by 1.
Glove.....	To convert number of sponges to weight in pounds multiply by 1.5.
Grass.....	To convert number of sponges to weight in pounds multiply by 2.5.
Wire.....	To convert number of sponges to weight in pounds multiply by 1.5.
Yellow.....	To convert number of sponges to weight in pounds multiply by 1.5.

Parties wishing to receive current copies of this report and statistical bulletins issued by the bureau should request that their names be placed on the bureau's mailing list No. 128 for the annual statistical report, No. 128a for general statistical bulletins, and No. 128b for monthly cold-storage reports.
