APPENDIX III TO REPORT OF COMMISSIONER OF FISHERIES
FOR THE FISCAL YEAR 1938

UNITED STATES
GOVERNMENT PRINTING OFFICE
WASHINGTON : 1938

ADMINISTRATIVE REPORT SERIES

Since the beginning of the Administrative Report Series, considerable confusion has arisen concerning the system of numbering the separates composing it. Inasmuch as the Reports of the Divisions vary in order from year to year, many have found their designations as "Appendix No. I, II, III, or IV" very confusing. To relieve this, it has been decided to number them as "Administrative Report No. —." Inasmuch as 20 separates had already been printed in this series before starting the numbers, it was deemed advisable to begin the numbering with Administrative Report No. 21. Of course, numbers cannot be printed on those already off the press, but for the information of those who wish to know what the first 24 were, they are numbered for filing purposes as follows:

- No. 1. Report, Commissioner of Fisheries, 1931.
- No. 2. Alaska Fishery and Fur-Seal Industries, 1930.
- No. 3. Fishery Industries of the United States, 1930.
- No. 4. Progress in Biological Inquiries, 1930.
- No. 5. Propagation and Distribution of Food Fishes, 1931.
- No. 6. Report, Commissioner of Fisheries, 1932.
- No. 7. Alaska Fishery and Fur-Seal Industries, 1931.
- No. 8. Fishery Industries of the United States, 1931.
- No. 9. Progress in Biological Inquiries, 1931.
- No. 10. Propagation and Distribution of Food Fishes, 1932.
- No. 11. Alaska Fishery and Fur-Seal Industries, 1932.
- No. 12. Progress in Biological Inquiries, 1932.
- No. 13. Fishery Industries of the United States, 1932.
- No. 14. Propagation and Distribution of Food Fishes, 1933.
- No. 15. Fishery Industries of the United States, 1933.
- No. 16. Alaska Fishery and Fur-Seal Industries, 1933.
- No. 17. Progress in Biological Inquiries, 1933.
- No. 18. Propagation and Distribution of Food Fishes, 1934.
- No. 19. Alaska Fishery and Fur-Seal Industries, 1934.
- No. 20. Fishery Industries of the United States, 1934.
- No. 21. Progress in Biological Inquiries, 1934.
- No. 22. Propagation and Distribution of Food Fishes, 1935.
- No. 23. Alaska Fishery and Fur-Seal Industries, 1935.
- No. 24. Fishery Industries of the United States, 1935.

Note that the last Commissioner's Report was for 1932. Since then its place has been taken by a reprint from the Report of the Secretary of Commerce under the title "Bureau of Fisheries." Inasmuch as it is no longer a Bureau publication, it is not numbered; but it will be supplied to any who request the Report of the Commissioner for any year since 1932.

¹ Administrative Report No. 32, Appendix III to the Report of the U. S. Commissioner of Fisheries, 1938. Approved for publication, June 23, 1938.

FOREWORD

This report constitutes a summary of the activities of the Division of Fishery Industries as well as a review of the fishery statistics collected by the Division during the past year. As its name indicates, this Division of the Bureau is concerned with the activities and welfare of the commercial fisheries and fishery industries and the fishermen and shoresmen engaged therein; the fish canning and preserving industries; and the trade in fishery products. Its functions include the conduct of studies or activities: (1) To determine the extent and magnitude of our aquatic resources and the commercial importance of our fishery industries; (2) to learn the economic condition of fishermen and shoresmen engaged in the fishery industry, their place in the national economy, and what measures can be taken to improve their well-being; (3) to determine the character, utility, and effectiveness of different forms of fishing apparatus and vessels, suggest improvements therein, and discourage the use of those forms which are unnecessarily destructive or unprofitable; (4) to learn the effect of fishing on the supply of fish and suggest measures to promote orderly and sustained production; (5) to study and develop fisheries for hitherto unutilized fishes; (6) to investigate the preservation of fishery products, suggest improved methods, and discourage wasteful practices in this field; (7) to ascertain what use can be made of aquatic products not now utilized to economic advantage; (8) to inquire into the nutritive value of aquatic foods for man and his domestic animals, and promote the consumption of these foods; (9) to ascertain the means and methods of transporting fishery products on land and sea and recommend economical practices; (10) to inquire into the condition and extent of the wholesale and retail trade in fishery products and promote the more orderly marketing of our fishery harvest; (11) to introduce useful foreign methods or processes of capture, preservation, utilization, or marketing fishery products; (12) to handle matters relative to the administration of the act which authorizes cooperative associations of producers of aquatic products; and (13) to conduct the fishery market news service authorized by act of Congress in 1937.

Results of the various technological, economic, and marketing investigations carried on by the Division are published in separate documents as each project is completed, and a brief résumé of each current project is contained in this report. Information obtained from statistical surveys is published in part 2 of this report, which includes all the detailed statistical information that has become available since issuance of the previous report,² together with such summarized statements and interpretations of the statistics as are deemed significant and useful.

Part 1. OPERATIONS OF THE DIVISION

COOPERATION WITH OTHER FEDERAL AGENCIES

In line with established policy, the Division cooperated during the year with other Federal agencies where their activities required information or advice concerning the technology, economics, or statistics of the fishery industries, and, similarly, this Division utilized the ex-

² Fishery Industries of the United States, 1936, by R. H. Fiedler: Appendix I to the Report of the U. S. Commissioner of Fisheries for 1937, pp. 1-276.

perience of other Federal agencies where they could assist by furnishing data or counsel in the work of this Division.

More specifically, both the economics and technological staffs cooperated with the Federal Surplus Commodities Corporation in connection with its purchase for relief agencies of surplus fish, and with the distribution of this fish to relief clients. The economics staff aided by determining the quantities and location of such stocks of fish to facilitate purchase, while the technological staff cooperated in assembling data on, and in conducting practical demonstrations of, the nutritive value of fishery products and fish cookery.

The technologists of the Division gave courses in canning fishery products to State Extension Service workers at the request of the State Extension Service of the United States Department of Agriculture.

Our technologists also rendered considerable assistance to chemists of the Bureau of Home Economics of the United States Department of Agriculture in assembling data on the chemical composition and food value of the leading commercial species of fish and shellfish. These data are to be incorporated by the Bureau of Home Economics in a revised publication on the composition of principal American food materials.

Chemists of the Food and Drug Administration, United States Department of Agriculture, conferred at length with our technologists for the purpose of obtaining information on methods of determining fatty acid in fish meal and the effect of the presence of relatively large amounts of fatty acid in fish meal on its feeding value.

Assistance was given by the statistical and economics staffs to members of the Rural Electrification Administration in connection with the importance of the commercial fisheries in certain areas of Virginia and North Carolina in which that agency was conducting studies.

Our economists and statisticians were of considerable assistance to members of the staff of the Bureau of Chemistry and Soils in their assembly of historical data, especially of a statistical nature, relating to the domestic manufacture of fish scrap and meal.

In the conduct of several phases of economic and technological work, the Division received the cooperation of the International Fisheries Commission at Seattle, Wash. This included certain technical studies on halibut and halibut-liver oil, and the collection of economic and statistical data on the North Pacific halibut fishery.

The Bureau also has worked with various Federal agencies in obtaining statistical data on our fisheries. In a cooperative arrangement, the Bureau of Agricultural Economics, Department of Agriculture, furnished statistics on the volume of cold-storage holdings of fish and quantities frozen, and the health authorities in Washington, D. C., assisted in obtaining data on the volume of fish handled at the Municipal Fish Wharf and Market in this city. Cooperation was accorded the Bureau of the Census in obtaining for that Bureau figures on the volume of the quarterly production and holdings of fish oils in the United States.

In addition to the specifically enumerated instances of cooperation with other Federal agencies cited above, which are on a continuing basis or were of a more detailed nature, it should be stated that a very close relationship exists between this Division and many of those Federal agencies whose duties require an interest in fish in particular, foodstuffs or feedstuffs in general, or in the various marine activities.

The staff of the Division is in almost daily contact with some one or more of these Federal agencies in the exchange of information of inestimable value to the scientific work of the Federal establishment.

COOPERATION WITH STATE AGENCIES

The Bureau of Fisheries long ago began establishing cooperative relations with the States in fields of mutual interest and endeavor and, in succeeding years, has constantly encouraged, fostered, and expanded this cooperative plan of work. By working closely, whenever possible, with the members of the staffs of various State laboratories, institutions, and agencies, the Division has been able to increase the productivity of the relatively small staff and carry out cooperative investigations at considerably less cost.

During 1937, the following cooperative investigations with various States were conducted:

At Washington State College, Pullman, Wash., the Seattle technological laboratory staff cooperated with Dr. J. S. Carver in carrying on tests with poultry in the feeding of fish oils and meals.

As in past years members of the faculty and staff of the University of Washington, Seattle, Wash., worked in conjunction with the staff at the Seattle technological laboratory in the conduct of various studies or investigations relative to the preservation of fishery products of the Pacific coast. In addition, the University of Washington placed space at the disposal of members of the Seattle laboratory for the conduct of technological studies, for which space was not available in the Bureau's building.

The University of Maryland and the Maryland State Agricultural Experiment Station, College Park, Md., have given excellent cooperation to our technological staff. Free space for the Bureau's laboratories in two of its buildings (discussed elsewhere in this report) has been provided by the University of Maryland, and both the University and the Maryland State Agricultural Experiment Station are conducting in their various laboratories and departments of animal husbandry cooperative studies of the feeding value of fishery byproducts. The members of the staffs of these two institutions who have worked closely with the College Park technological staff are Dr. L. B. Broughton, Head of the Chemistry Department; Dr. W. C. Supplee and Mr. L. E. Bopst, of the Chemistry Department; Dr. L. H. James, Head of the Department of Bacteriology; and Professor M. H. Berry of the Dairy Department. These cooperative investigations in the above-mentioned State universities and institutions are described in greater detail elsewhere in this report.

The technologists of the Division of Fishery Industries cooperated with Mr. L. E. Bopst and other chemists of the Maryland State Chemistry Department in developing methods for determining fatty acid in fish meal and the effect of the presence of relatively large amounts of fatty acid in fish meal on the subsequent feeding value of the fish meal.

Mr. Otto Lang, chemist of the Hooper Foundation, University of California, San Francisco, Calif., who is conducting and improving a State inspection service of fish as food, spent considerable time in conferences with our technologists in connection with the possible application of the Bureau's electrometric test for determining the relative

freshness of fish, and other methods developed by our technologists, to his studies for the State of California.

Our technologists continued their active cooperation, during the past year, with the Minnesota and Virginia State Departments of Markets in connection with the extension and improvement of State marketing grades for fishery products sold in those States. In Virginia one of the Bureau's technologists assisted the State inspector in preparing grades for herring roe, discussed in detail elsewhere in this report.

In the conduct of its statistical research work, the Bureau obtains unusual cooperation from various States. The statistical surveys of the fisheries in the various States bordering on the Great Lakes, in the Pacific Coast States, and in Maryland, Virginia, and Delaware have been greatly facilitated by the cooperation obtained from the fishery agencies in these States. With this aid it is now only necessary for the Bureau to conduct partial surveys in these States to supplement the data available from the fishery agencies.

In addition, in nearly every other State where commercial fishing is prosecuted, some type of cooperation in its statistical work is rendered the Bureau by the State fishery agencies or other organizations. This makes it possible for the Bureau to make statistical surveys of a greater portion of our fishery industries than otherwise would be possible.

COOPERATION WITH FISHERY ADVISORY COMMITTEE

Members of the staff of the Division worked very closely during the year with the Fishery Advisory Committee of the Business Advisory Council for the Department of Commerce. This work took its principal form in the planning of demonstrations and preparation of informative material for the meeting of the Committee in Washington, D. C., on January 21 and 22, 1938.

As a part of the program arranged for the members of the Committee, the Division gave numerous demonstrations of its work. These included an historical review and discussion of current trends of our commercial fisheries, by the Chief of the Division, with the use of a specially prepared series of charts. The modern methods employed by the Bureau in preparing the large volume of fishery statistics which are collected and disseminated by the Bureau were demonstrated and explained by E. A. Power. Demonstrations of technological studies included an experimental method for the canning of the blue crab by N. D. Jarvis; the electrometric method for determining the freshness of fish, by J. M. Lemon and M. E. Stansby; a new method of treating fish by "controlled smoke" to obtain a uniform product, by W. T. Conn; experiments looking toward reduction of bacteria in fish by use of ultraviolet rays, by J. F. Puncochar; and methods for protein analysis of fish, by S. R. Pottinger. Recent studies relating to the food value of fish, and especially pointing out the large reserves of vitamins, proteins, and essential minerals contained in seafood, were discussed by J. R. Manning and others of the technological staff. These discussions were concerned with nutritional studies on fish oils, by C. F. Lee; fish proteins, by W. B. Lanham; and minerals in fishery products, by Hugo Nilson.

The Division also aided extensively in the planning of the seafood dinner held at the Mayflower Hotel on January 21, 1938, by members

of the Fishery Advisory Committee and others. It further contributed numerous articles and graphic charts for the pamphlet entitled "Facts—The Key to Progress."

EXHIBITS AT EXPOSITIONS

During 1937, the Division continued its supervision of the Bureau's exhibits at the Texas Centennial Central Exposition at Dallas, Tex., and the Great Lakes Exposition at Cleveland, Ohio, both of which ran during second year; and arranged for displays for the Florida State Fair in Tampa, Fla., and the International Exposition of Paris, France. These exhibits attracted considerable attention from visitors and assisted materially in bringing before our people the need and value of fishery conservation.

TEXAS CENTENNIAL CENTRAL EXPOSITION

At the conclusion of this exposition, the main feature of the Bureau's display, consisting of a sport-fishing diorama, was sent to Tampa, Fla., and installed in the fisheries building of the Florida State Fair. This will remain on display there for the Pan American Exposition in Tampa in 1939.

GREAT LAKES EXPOSITION

At the conclusion of this exposition a portion of the display was loaned to the University Museums of the University of Michigan, Ann Arbor, Mich., for display in the fishery hall. This consisted of the mechanically-operated diorama depicting the effect of thermal conditions in Lake Erie on the commercial capture of fish, a diorama of fish-hatchery operations, models of Great Lakes fishery apparatus, a display explaining net preservative treatments, and miscellaneous canned fish products. Another portion of the display, consisting of a panel of articles made from fishery products, was loaned to the Conservation Division of the State of Ohio and placed on display in the Bureau's fish hatchery building at Put in Bay, Ohio.

INTERNATIONAL EXPOSITION AT PARIS, FRANCE

The Division prepared an exhibit of the Bureau's activities for use in the United States Government Building at this exposition in 1937. This consisted of a series of 24 colored transparencies of 16 by 20 inches each, arranged in a wall panel, and depicted the Alaska salmon fisheries, the Bureau's research work on fishery technology and biology, and its work in the propagation and distribution of fish. Each transparency was titled in both English and French. The Bureau was allotted \$250 for the preparation of this exhibit. At the conclusion of the Exposition the transparencies were returned to the Washington office.

NEW YORK WORLD'S FAIR, AND GOLDEN GATE EXPOSITION, 1939

Members of the Division have devoted considerable time to plans for Bureau exhibits at the New York World's Fair, 1939, and the Golden Gate Exposition, 1939, at San Francisco, Calif. Federal displays or exhibits for these two fairs will not be constructed by the various Government agencies, as heretofore. Rather, these agencies

will advise the Federal Commissions for the fairs of their respective activities, and these then will be incorporated in theme dioramas, which are to be constructed by the Fair Commission for display in the respective Federal buildings at the two fairs. The work of the Bureau at the New York Fair will be depicted in the following themes: Conservation, food, industry, recreation, and territories; and in the conservation theme at the Golden Gate Exposition. A separate Government committee has been appointed to develop plans for each theme and members of the Division's staff are acting on the theme committees, as indicated above. For the science display at the Golden Gate Exposition the Bureau is lending its panels depicting the migration of the Alaska salmon, and the eels of the Atlantic Ocean.

Members of the Division are also working in close cooperation with the New York World's Fair Administration on the development of a special Fishery Building to house industry exhibits, both foreign and domestic, and displays of various State fishery agencies, conservation leagues, and others. This is the first time a fair administration has made plans for a separate building of this type. The fair administration is desirous of having a display in this building by the Bureau of Fisheries, but to this date it has been impossible to arrange for it since funds for the purpose have not been provided.

SEVENTH WORLD'S POULTRY CONGRESS, 1939

Members of the Division also are cooperating with the United States Commission for the Seventh World's Poultry Congress in the preparation of an exhibit for display at Cleveland, Ohio, in July 1939, during the proceedings of the Congress. The Bureau's exhibit will consist of displays showing sources and manufacture of fish meal, oil, ground oyster shells, and other aquatic products which are used as feeds for poultry. The poultry industry is one of the principal consumers of these domestic fishery products, and it is expected the display will be of unusual benefit to industries manufacturing these commodities.

GENERAL

During the year the Division prepared exhibits for display at various sportsmen's fairs, and for several trade and professional association meetings which convened in Washington, D. C. These exhibits for use at the sportsmen's fairs consisted mainly of dioramas depicting the research work of the Bureau relative to fish propagation and oyster culture, while those for use at the trade meetings consisted of displays of the food value of fish, and charts and graphs showing the magnitude of the fisheries in the United States and Alaska.

During the past year the Bureau has experienced an unusual demand for display exhibits at various sportsmen's shows, fairs, and trade meetings and for window displays and school exhibits. These requests have come from groups in many parts of the country. Because of the costs involved the Bureau has been unable to fill these requests, except where it had material available from past fairs and where costs for transportation were not involved. This desire for exhibit material on the part of the general public indicates to the Bureau that many of our people are greatly interested in fishery conservation work, and that if it were possible to fill all the requests a greater portion of our population might obtain a clearer insight into the need for wildlife conser-

vation, and a better knowledge of what can be done to promote conservation.

ECONOMIC AND MARKETING INVESTIGATIONS

There is a constant demand upon the Division of Fishery Industries for studies of the economics of the commercial fisheries, including investigations having application to the various functions of the marketing of fishery commodities. It has been possible to undertake only a limited program of long-time or continuing studies of this kind with available personnel and funds during recent years. It was necessary to further curtail work of this type during the past year due to the large volume of time required of the regular staff in connection with the planning and organizing of the Market News Service, to be discussed later in this report. However, as is customary each year, many short-time economic studies were made in order to satisfy the urgent demands placed upon the Division. Such studies most frequently are conducted preliminary to or closely associated with administrative activities of the Bureau and usually are not published. Results of some of these studies which were made during the past year are discussed briefly in the following paragraphs.

SURPLUS-FISH SITUATION

A study of the surplus-fish situation was made by the staff of the Division during March, and the findings were presented on March 29, 1938, by the Chief of the Division at the hearings before the Committee on Merchant Marine and Fisheries of the House of Representatives on H. R. 9765 and S. 3595 relating to the purchase and distribution of products of the fishery industry. The study made in the Division developed the following information:

Frozen and cured fish.—As of March 15, 1938, the holdings of frozen fishery products in cold-storage warehouses in the United States amounted to 45,700,000 pounds. This is 13,200,000 pounds in excess of the normal or 5-year average of the holdings as of March 15 and 5,900,000 pounds less than the holdings as of March 15, 1937. On March 15, 1937, the holdings were 22,371,000 pounds above normal, or 5-year average as of that date. Thus, the excess holdings this year on March 15 over the 5-year average are 9,100,000 pounds less than the holdings as of March 15, 1937, over the 5-year average, at that time. Under congressional authority in 1937, the Federal Surplus Commodities Corporation purchased a little over 12,000,000 pounds of fishery products (most of which was frozen) at a cost of about \$621,000.

The excess holdings as of March 15, 1938, over the 5-year average as of this date, were made up principally of dressed and filleted cod, haddock, and pollock, and shellfish (mostly shrimp), sablefish, rosefish, salmon (mostly fall and pink varieties) and halibut. On March 15, 1937, the excess over the 5-year average as of that date was accounted for mainly by the large holdings of whiting, various species of groundfish (cod, haddock, pollock, etc.), and rosefish.

On March 15, 1938, the holdings of cured herring amounted to 13,200,000 pounds, or about 4,200,000 pounds less than on the same date a year ago, but about 2,500,000 pounds more than the 5-year average. On March 15, 1937, the holdings of cured herring were

about 6,400,000 pounds more than on the same date in 1936 and 7,500,000 pounds more than the 5-year average as of that date.

In 1937, the landings of fish at the principal New England ports (Boston and Gloucester, Mass., and Portland, Maine) where the bulk of the catch of fish by New England vessels is landed, amounted to 388,000,000 pounds or about 26,300,000 pounds less than the landings at these ports in 1936. Decreases were recorded mainly in the landings of mackerel, whiting, pollock, and rosefish. Several of these species are the same as those which had large cold-storage holdings on March 15, 1937. Several other species recorded minor decreases. Increases were recorded mainly by cod, hake, cusk, and flounders. Among these species which had excess holdings as of March 15, 1938, over the 5-year average as of this date, there were cod, hake, and cusk.

In 1937 there were 168,200,000 pounds of fishery products frozen in the United States compared with freezings of 179,300,000 pounds in 1936 and a 5-year average of 130,000,000 pounds. In 1937, it is estimated that 183,000,000 pounds of frozen fish were withdrawn from cold storage as compared with 159,000,000 pounds in 1936 and a 5-year average of 125,700,000 pounds.

Canned fish.—Figures on the estimated holdings of canned fish were obtained by telegram and letter from various fishery associations. It is assumed the following figures thus obtained refer to stocks held by packers.

The holdings of canned tuna, in standard cases of 48 one-half pound cans to the case, as of March 15, 1938, were reported as 649,000 cases (15,600,000 pounds) compared with 247,000 cases (5,900,000 pounds) on the same date a year ago. No data are available as to the comparison of the holdings with a 5-year average.

The holdings of canned shrimp, in standard cases of 48 No. 1 cans to the case, as of March 15, 1938, amounted to 290,000 cases (4,400,000 pounds) compared with 60,000 cases (900,000 pounds) on the same date a year ago, and 118,000 cases (1,800,000 pounds) on March 15, 1936. There is no figure available as to the 5-year average as of March 15.

The holdings of canned oysters, in standard cases of 48 No. 1 cans to the case, were 122,000 cases (1,830,000 pounds) as of March 26, 1938, and 123,000 cases (1,850,000 pounds) as of April 1, 1937. No data are available as to the 5-year average.

It is understood the carry-over of canned alewife roe in the Chesapeake Bay area is considerably greater as of March 15 this year than the holdings as of March 15 a year ago.

There was no surplus stock of canned California sardines, in 1-pound oval cans, as of March 26, 1938, and the same condition obtained in March 1937. Most of the pack of California sardines is put up in 1-pound oval cans.

The holdings of canned Maine sardines in cases containing an average of about 35 pounds of fish to the case, were 350,000 cases (12,250,000 pounds) as of March 15, 1938, and about 215,000 cases (7,500,000 pounds) as of the same date a year ago. Information was not available as to the amount of the 5-year average as of March 15.

No data are available on the situation with respect to canned mackerel in California. It is doubtful, however, whether there is any

appreciable carry-over, since the pack in 1937 was considerably less than in 1936 or 1935.

Reports indicate that the holdings of canned salmon of all kinds, in standard cases of 48 1-pound cans to the case, as of February 28, 1938, amounted to 3,429,000 cases (165,000,000 pounds) compared with 1,337,000 cases (64,200,000 pounds) on February 28, 1937. According to an estimate obtained from the annual statistical number of the Pacific Fisherman, dated January 25, 1938, the 5-year average amounted to about 2,200,000 cases (105,600,000 pounds).

A summary of the above information indicates that the holdings of fishery products in the United States, on which data were obtained, approximated 260,000,000 pounds on March 15, 1938. This represents an excess of approximately 80 to 100 million pounds above normal holdings.

An act, Public No. 542, to authorize the purchase and distribution of products of the fishing industry was approved on May 25, 1938. It provides:

That, out of any funds available to the Federal Surplus Commodities Corporation, not to exceed a sum equal to the difference between \$1,000,000 and the sum expended by such Corporation in carrying out the provisions of the joint resolution entitled "Joint resolution to make funds available to carry out the provisions of existing law authorizing the purchase and distribution of products of the fishing industry," approved April 12, 1937, may be used by such Corporation for the purpose of diverting surplus fish (including shellfish) and the products thereof from the normal channels of trade and commerce by acquiring them and providing for their distribution through Federal, State, and private relief channels.

IMPROVED COLD-STORAGE STATISTICS

Progressive fish dealers in our markets are cognizant of the approximate volume of current supplies of fresh fish in their marketing area. The amount of fish in cold storage is not so apparent to them, yet such supplies, which have an important influence on the markets for fresh fish, are frequently many times the volume of fresh fish on hand at any given time. In order that interested parties may be apprised of the amount of fish in cold storage and quantities frozen, the Division, with the cooperation of the Cold Storage Section of the Bureau of Agricultural Economics, publishes monthly and annually bulletins which include this information.

In order that these reports may be of the greatest value to interested parties, this Division and the Bureau of Agricultural Economics make frequent revisions in the questionnaires submitted to cold-storage firms in order that new commodities or those of growing importance may be incorporated in the report. Thus, separate classifications have been added in recent years for fillets of various species as their importance increased in our markets; a new classification was added for rosefish, which is the product of a virtually new fishery; and another was added for swordfish, due to the increasing volume of imports of this commodity in the frozen state from Japan and subsequent storage in domestic warehouses.

New species classifications will be added on July 15, 1938, for scallops, a large volume of which also is imported from Japan; for shrimp, the domestic freezing of which has increased rapidly in recent years; and for sea crawfish or spiny lobster tails which have been imported in growing quantities, especially from South Africa.

Statistics of quantities of frozen fish moving in and out of cold storage and the amount of fish in cold storage are given daily and weekly, respectively, in the fishery news releases issued by the Division's market news offices in Boston, Mass., and New York, N. Y. This service is discussed in greater detail elsewhere in this section.

UNITED STATES FISHERIES OFF FOREIGN COUNTRIES

A study made during the year shows that about 14 percent of the value of the catch of the domestic fisheries is represented by products taken off foreign coasts. Specifically, the sources and classes of the more important of these products were as follows: Off Newfoundland and Nova Scotia, principally cod, haddock, and other groundfish, 151,000,000 pounds, valued at \$4,600,000; off the west coasts of Latin American countries, mainly tuna and tunalike fishes, 121,000,000 pounds, valued at \$5,900,000; off British Columbia, largely salmon and halibut, 16,000,000 pounds, valued at \$1,000,000; off the east coast of Mexico (Campeche Bank), chiefly red snappers and groupers, 4,000,000 pounds, valued at \$200,000; and off Australia, 1,508 whales (weight undetermined), from which were produced whale and sperm oil valued at \$1,300,000. It will be observed that the total value of the fisheries off foreign coasts to domestic fishermen was about \$13,000,000.

MIGRATORY FISH OF THE ATLANTIC AND GULF COASTS

Members of the Division's staff devoted a great deal of time during the year to the preparation of historical statistics and graphic charts of the catch of migratory fish and shellfish common to the Atlantic and Gulf coasts for use in the deliberations of the two eastern zones of the National Planning Council of Game and Commercial Fish Commissioners at their meeting with officials of this Bureau in Atlantic City, N. J., on February 6, 1937.

The data prepared in this Division covered the trends of the catch of 17 important migratory fish and shellfish. These data were supplemented by members of the staff of the Division of Scientific Inquiry to include discussions of the physical characteristics and habits of these species, and all the material was included in Special Memorandum No. 3239, entitled "Migratory Fish of the Atlantic and Gulf Coasts." The species covered by the report were cod, haddock, flounders, mackerel, sea herring, whiting, scup, sea bass, shad, alewives, croakers, squeteagues, Spanish mackerel, mullet, lobsters, crabs, and shrimp.

COMMERCIAL FISHERIES OF THE WORLD

On the basis of the most recent available data, the United States, including Alaska, ranks first in value of annual yield of fishery products among the countries of the world and is exceeded only by Japan in the volume of the yield. The catch by commercial fishermen of the United States, based principally on data for 1936, amounted to 4,800,000,000 pounds, valued at \$93,000,000, while that of Japan, which is partly estimated, amounted to 6,600,000,000 pounds, valued at \$87,000,000. Other countries whose annual commercial fisheries catch exceeded 1 billion pounds were Union of Soviet Socialist

Republics, England (including Scotland, Northern Ireland and Wales), China, Norway, Canada and Germany. The world's annual commercial catch of fishery commodities is about 30,000,000,000 pounds, valued at \$730,000,000.

DOMESTIC MARKETS FOR LOBSTERS AND SPINY LOBSTERS

In view of the interest manifested in connection with the increasing imports of lobsters and spiny lobsters from foreign countries, the Division conducted a study of the trend in this trade.

Preliminary data, compiled by the Bureau of Foreign and Domestic Commerce, show that the imports of fresh and frozen products of both of these crustaceans during 1937 amounted to 14,700,000 pounds, and canned products 800,000 pounds, or a total of 15,500,000 pounds, exceeding the total imports in 1936 by 29 percent, and the average of the 10 years ending in 1936 by 43 percent. This increase is reflected entirely in the fresh and frozen products, there having been a downward trend in recent years in the imports of the canned commodity.

Large increases were recorded for imports of fresh and frozen lobsters and spiny lobsters during 1937. Specifically, the imports of fresh and frozen lobsters, which come almost entirely from Canada, increased from 8,800,000 pounds in 1936 to 10,700,000 pounds, or 21 percent, in 1937. This increase was most interesting in view of the fact that for several years prior to 1937 the total imports of this commodity had not reached 9,000,000 pounds. The imports of fresh and frozen spiny lobsters increased from 2,300,000 pounds in 1936 to 4,000,000 pounds in 1937, or 74 percent. Probably even of more interest in connection with the imports of fresh and frozen spiny lobsters is the fact that as late as 1932 imports amounted to only 763,000 pounds and during the decade prior to 1934 receipts from foreign countries had never exceeded 1,200,000 pounds.

The principal sources of our imports of spiny lobsters, in order of their importance, are Union of South Africa, British West Indies, Mexico and Cuba. Small quantities come from other tropical and subtropical countries.

Among the important countries which supply us with fresh and frozen spiny lobsters, the Union of South Africa has made most rapid strides in marketing her product in this country. Imports from that country increased from 1,020 pounds in 1934 to 130,000 pounds in 1935, 570,000 pounds in 1936, and 1,700,000 pounds in 1937. Our imports from the British West Indies have grown nearly as rapidly, increasing from 290,000 pounds in 1934 to 1,100,000 pounds in 1937. Cuba's shipments to this country increased from 38,000 pounds in 1934 to 207,000 pounds in 1937. Imports from Mexico have varied between 840,000 pounds and 940,000 pounds during the past 4 years.

The domestic catch of lobsters in recent years has varied from about 10,000,000 pounds to 14,000,000 pounds and that of spiny lobsters from 1,500,000 pounds to 1,900,000 pounds.

IMPORTATION OF COTTON FISH NETTING

The imports of cotton fish netting from foreign countries has been consistently increasing during the past 4 years, according to foreign trade statistics compiled by the Bureau of Foreign and Domestic

Commerce. In 1934, when the first import statistics of this commodity were published, our total receipts from foreign countries amounted to 338,000 pounds, valued at \$124,000. Preliminary data show that in 1937 imports amounted to 846,000 pounds, valued at \$255,000, representing increases of 150 percent in volume and 106 percent in value in the 4-year period.

Of especial interest with relation to the domestic market for foreign produced netting is the fact that while in each of the years for which data are available Japan contributed most of our imports of this commodity, her percentage of the total volume of imports increased from 63 percent in 1934 to 95 percent in 1937. Other countries from which cotton fish netting was received in this country in 1937 were Netherlands and United Kingdom, with very small quantities from Canada, Germany, France, Belgium, and Czechoslovakia.

INTERCHANGEABILITY OF USES OF OILS AND FATS

In publications of the Bureau and in previous annual reports of this Division the technical and economic aspects of the general interchangeability of the uses of all saponifiable oils and fats of animal and vegetable origin, and their effect on markets for and uses of fish oils, have been discussed in considerable detail. Because of the influence of this factor on many important American industries, it has become of increasing interest and importance during the past year. Particularly has it been a factor to be considered in the Government's program of reciprocal trade agreements. Consequently, technologists and economists of this Division spent considerable time during 1937 in assembling special data on this subject from the Bureau's files for officials of the State Department, the Federal Trade Commission, the Bureau of Customs of the Treasury Department, members of Congress, and representatives of trade associations.

ACTIVITIES OF THE FISHERY COMMITTEE OF THE NATIONAL ASSOCIATION OF MARKETING OFFICIALS

The Fishery Committee of the National Association of Marketing Officials was appointed in October 1936 at the association's convention in Nashville, Tenn., to deliberate on problems in connection with the marketing of fish which come before the association. While this is a very new committee, it already has shown much interest in fishery work and bears promise of most fruitful accomplishments in the future.

The members consist of J. H. Meek, Director, Division of Markets, Virginia, Chairman; Charles M. White, Chief, Division of Markets, Maine; and L. M. Rhodes, Commissioner of Markets, Florida. It will be observed that in each instance the members of the committee represent marketing agencies of States which are important in the commercial production of fish and shellfish.

The first meeting of this committee, following its appointment, was held in Washington, D. C., on April 26, 1937. On that occasion, as a means of developing general policies and plans for study, it discussed nine questions having important bearing in connection with the marketing of fish. Answers which reflected the opinions of the committee were then reported at the Nineteenth Annual Convention of the National Association of Marketing Officials, held in New York

City on December 18, 1937. The questions and answers as developed by the committee were as follows:

1. How can the State officials cooperate in the conduct of the Market News Service for fish, established July 1, 1937, by the United States Bureau of Fisheries?

It appears that the Market News service for fish in each State can be coordinated with the State Market News service for agricultural commodities.

2. How can the State officials aid cooperative marketing associations of fish producers?

Give them the same support that is given producers of agricultural commodities.

3. Should the Federal Government extend loans to Fishery Cooperatives?

In the same way that loans are extended to cooperatives handling agricultural commodities.

4. Should the State marketing or other State agencies take a greater interest in conducting economic studies of the marketing of fishery products?

Where there are economic studies relating to agricultural commodities, similar studies should be made relating to the marketing of fishery products.

5. Should the State marketing or other State agencies aid in the conduct of a fishery extension service to aid producers in marketing improved fishery products and to acquaint housewives with the food value of fishery products?

The same as agricultural commodities or other foods.

6. Should schools and colleges give consideration to the teaching of fishery economic and technical subjects—especially in those States where fishing is an important industry?

This seems essential if proper progress is made.

7. Should a Federal-State inspection service, of voluntary nature, be established for fishery products?

It is exceedingly important that a voluntary Federal-State inspection service for fishery products be established without delay.

8. Should consideration be given to the establishment of small inexpensive warehouses at important fish-production centers to hold, temporarily, surplus supplies of fresh fish pending more favorable marketing conditions?

This is a matter that should be given careful consideration and gradually developed to meet the needs of individual cases.

9. Should consideration be given the development of a fishery conservation plan along the line of the soil conservation subsidy?

This is needed to protect, conserve, and develop the industry.

The Chief of the Division addressed the New York Convention of the National Association of Marketing Officials on December 18, using as his subject "Outline of Fishery Market News Service." This address was received with considerable interest, especially in connection with the application of this new work of the Division in the various States represented by the delegates.

At the time of the convention of the Atlantic States Division of the National Association of Marketing Officials, held in Washington, D. C., in April 1938, members of the association's Fishery Committee, marketing officials from other coastal States, the writer and members

of his staff, met to discuss policies of general cooperative activities in connection with the Division's new fishery market news service. It was pointed out by the Division's staff that funds were so limited for this new work that it would be impossible to communicate by telegraph on a daily basis the voluminous market information collected by the Division to State marketing offices for their dissemination to interested parties. Consequently, it was the concensus of the meeting that for the present these market news reports should be mailed to the State agencies and those having facilities would develop means for dissemination. It was further suggested that as the States developed suitable procedures for dissemination, adequate funds might be made available by the States to cover telegraph costs or to conduct some of the work of collection of data in their States, which would relieve the Division of portions of its expense in order that it could take over communication costs. The policy of mailing these market news reports to State marketing offices has been followed by the Division and some of the States have already indicated that they are conducting studies in connection with the marketing of fish in order that they may more intelligently disseminate this new type of information.

TRENDS OF THE BLUE CRAB INDUSTRY

An interesting geographical movement of the blue crab industry was revealed by a study of the official statistics of the products of this industry. As late as 1930 the States of Maryland and Virginia dominated the fishery for this crustacean, accounting for nearly 68,759,000 pounds. In that year the entire marine coastal area of the South Atlantic and Gulf States contributed only 7,024,000 pounds to the domestic catch. By 1936 the Chesapeake production had decreased to 43,670,000 pounds while that of the South Atlantic and Gulf States had increased to 29,831,000 pounds. The outstanding States contributing to this latter production in 1936 were Louisiana, 12,942,000 pounds; North Carolina, 6,591,000 pounds; and Florida, 3,194,000 pounds. With the development of this more southern crab fishery, fresh-cooked crab meat from the area is becoming a factor of increasing importance in the northern market.

For instance, the production of fresh-cooked crab meat in Louisiana in 1931 amounted to only 175,000 pounds, while in 1936 it had reached 1,035,000 pounds. During the same period the production of fresh-cooked crab meat in North Carolina increased from 188,000 pounds to 432,000 pounds, and in Florida from a practically nonexistent industry in 1931 to 316,000 pounds in 1936. This rapid growth of the fresh-cooked crab meat industry in the more southern States is contrasted with the decrease in the volume of fresh-cooked crab meat produced in the Chesapeake States from 5,794,000 pounds in 1931 to 3,581,000 pounds in 1936.

Of interest in connection with the domestic production of crab meat and its changing geographic trend are imports of foreign canned crab meat. According to preliminary data, imports of this commodity, which emanates principally from Japan, amounted to 11,157,000 pounds in 1937, which exceeds the imports in any year since 1931. The average imports for the 5 years prior to 1937 were 9,116,000 pounds.

THE ATLANTIC TUNA FISHERY

The fishery for tuna on the Atlantic coast in past years has been conducted almost entirely by sport fishermen; however, limited quantities have been taken incidentally in fisheries conducted primarily for other species. The interest in the sport fishery for this species has increased in recent years, and a considerable volume of the sportmen's catch frequently finds its way into our markets. In the capture of tuna, sport fishermen usually employ harpoons adapted from the swordfish fishery, hand lines, or troll lines. During the past year, several fares of tuna were reported landed at New England ports by vessels operating purse seines, which are one of the primary accepted gears used in the commercial fishery for tuna and tunalike fishes on the Pacific coast. Reports, of especial interest at this time, are that a modern purse seine vessel, the *Western Explorer*, has sailed from the Pacific coast through the Panama Canal to engage in a commercial fishery for tuna and mackerel in the New England fisheries and that the New England commercial fishery interests have already produced limited packs of canned tuna.

The commercial exploitation of this species on the Atlantic coast will be observed with great interest, especially in view of the rapid growth and present importance of the tuna industry in California where the Pacific coast industry is centered. It is most interesting to observe that the catch of tuna and tunalike fishes in California was of little consequence prior to about 1910, but today the value of the catch of these species ranks second only to salmon among all of the fisheries of the Pacific Coast States. The catch of tuna and tunalike fishes in 1936 amounting to 132,470,000 pounds, valued at \$6,565,000 to the fishermen. Tuna also ranks among the most important fisheries of the world. Based upon the most recent available data, the world's annual catch amounted to 675,000,000 pounds, valued at about \$24,000,000. This represents about 2 percent of the volume and 3 percent of the value of the catch of the world's fisheries for all species. Japan alone contributed 68 percent to the world's catch of tuna. Following in order were the United States with 21 percent; Spain, 4 percent; France, 3 percent; and Portugal, 1 percent. Other countries whose annual catch exceeded 1,000,000 pounds were Italy, Algeria, Tunisia, and Tripolitania.

NORTH PACIFIC HALIBUT FISHERY

During the past year George Roger Chute, assistant fishery economist, continued his economic study of the halibut fishery and industry of the North Pacific which was discussed in last year's report. This investigation covers a study of halibut vessel operation, transportation, warehousing, merchandizing practices, consumer attitude toward halibut, and a chronology of the fishery from its inception on the North Pacific.

GEOGRAPHICAL TRENDS IN THE PRODUCTION OF CANNED OYSTERS

The earliest oyster canning industry of any consequence in this country was centered on Chesapeake Bay. As late as 1921 Maryland was the principal producing State for canned and hermetically sealed oysters, contributing 153,000 standard cases to the United States total pack of 442,000 cases. More recently, the demand for shucked stock

and oysters in the shell has so completely utilized the available supply in the Chesapeake area that the canning of this mollusk in this region has been almost abandoned.

As the pack decreased in the Chesapeake Bay, increasing quantities of oysters were canned on the Gulf coast to supply the important Middle Western market, and in 1936 the pack in Mississippi of 223,000 standard cases was more than half that of the entire Atlantic and Gulf coasts. However, a newer and most important source of canned oysters is the State of Washington, where the Japanese or Pacific oyster is canned. In 1931, the pack in Washington was less than 8,000 standard cases, but by 1936 the oyster canning industry in Washington had grown to the point where its pack amounted to 119,000 cases or 23 percent of the domestic production.

COMMERCIAL ASPECTS OF SEAWEED INDUSTRIES

Considerable interest is shown in the various seaweed industries of the United States as is evidenced by the numerous inquiries which the Bureau receives and by the relatively large number of business men interested in the possibilities of new ventures and developments in the utilization of seaweeds. During the past year, several large chemical manufacturers sent representatives to confer with the Division's technologists regarding the preparation and utilization of sodium alginate, a widely used product made from kelp. Much interest is also shown in kelp meal as a mineral supplement for livestock rations.

With special reference to eel grass, it is of interest that this seaweed once furnished a considerable industry in New Jersey, Virginia, Maryland, and elsewhere along the Atlantic coast. An investigation made by the Division during the year brought out the fact that the current domestic requirements of this product are now furnished almost entirely from foreign sources. With the depletion of domestic beds of eel grass, the manufacturing consumers, who found it especially suitable as an insulating material, considered it necessary to import supplies from Nova Scotia, but more recently the supply has become limited there. It has, consequently, become necessary to import a European seaweed, although it is shorter and in other ways less suitable than the native product.

MARKETS FOR PERIWINKLES (*LITTORINA* SP.)

A study was made during the year of the commercial aspects of the capture and marketing of periwinkles. Information obtained by the Division's agents indicates that periwinkles are rather abundant in New England and that a small quantity is shipped from Maine each year to wholesale markets in Boston and New York. They are packed for shipment in the shell with seaweed and ice in either boxes or barrels. Quantities of periwinkles also are taken in Rhode Island and are used there largely for bait, both in commercial and sport fishing, although some quantities are shipped from Rhode Island to the New York market. Shipments also arrive in Boston regularly by steamer from Nova Scotia. It is understood that the meat of this form is somewhat similar to that of the hard clam. A customary way of preparing it for food is by boiling in the shell, and the broth resulting therefrom constitutes the edible product which is most popular among people of Italian descent.

STATISTICAL INVESTIGATIONS

Fishery statistics are collected by the Bureau to serve two principal purposes—biological and economic. For this reason the Bureau must plan its statistical surveys to obtain comprehensive data for furnishing a complete and reliable picture of the condition and trend of the fisheries. The collection and compilation of the great mass of data necessary involves many problems. The fisheries are broad in scope, including over 160 varieties of aquatic products which enter into commercial production. These, many of which are migratory, are taken by a great variety of types of gear in areas along our sea-coast and in our interior lakes and streams. If the biological aspect is to be served, complete annual statistics are needed on each of these phases in every section. If the economic aspect is to be served, statistics are needed not only on the phases listed above relative to the biological aspect, but also on the price structure, the processing function, and on marketing and distributing.

Statistics on these latter phases of the industry should be collected and published as soon as possible after the close of the business transactions in order to be of maximum value to the industry and others interested in the fisheries. However, because of limited funds and personnel it has not been possible to collect and publish these figures as currently as desired. For the same reason it has not been possible to collect statistics on the fisheries of the entire United States on an annual basis.

BIOLOGICAL ASPECT

The biological aspect must consider two problems—the conservation and sustained supply of the resource, and the prediction of future trends or yields. Since the fisheries are usually prosecuted in areas not under private ownership, the problem of the conservation of these fisheries is of national concern. It, therefore, is important that close watch be kept of the condition of the various fisheries to detect depletion so that remedial measures can be promulgated timely and wisely. For this reason it is imperative that current statistical data be obtained on the yield of our fisheries.

These statistics then furnish the biologist with the background upon which to base his prediction of future trends and yields. This he does by coupling the statistical data with studies of the life history of the species. Difficulty is experienced in making these predictions because the supply (or population) of the species cannot be seen, as is the case with farm animals or crops. The more complete and more reliable the statistics on yield are, the better foundation the biologist has for conducting his studies. The Bureau, therefore, aims to obtain a complete picture of each individual fishery to further these biological studies.

ECONOMIC ASPECT

When the fishery has been conserved, and trends and yields of the fishery have been predicted, the problem still remains of supplying the fishery trade with the information so essential to the conduct of its business activities. In these days of increased competition the very existence of the fishery industry must depend upon reliable economic and statistical information. Such material has been especially valuable during the past few years, when it has been used

in national planning. The Bureau, therefore, aims to make its statistical surveys so complete that the industry and the various governmental organizations may turn to it for reliable fishery statistics.

SURVEYS CONDUCTED

The statistical surveys during 1937 were conducted under the immediate supervision of Edward A. Power, assistant statistician, and the general direction of Fred F. Johnson, Assistant Chief of the Division. These surveys included the collection and dissemination of statistics of the commercial catch and its value, operating units, and employment in the fisheries. In addition, data were collected on employment and compensation of those engaged in the fisheries as well as products of fishery wholesale and manufacturing establishments.

As previously mentioned, limited funds made it impossible to cover all the fishing areas of the country during the past year for 1936. However, the following areas were surveyed: Chesapeake States, South Atlantic and Gulf States, Pacific Coast States, and Lake States. Statistics of the fisheries of Alaska also were collected by the Alaska Division of the Bureau. Summaries of the production in those sections which were not surveyed during the year are included for the most recent years available in part 2 of this report.

In addition to the above, statistics were collected on the following special phases: The landings of fish by American fishing vessels at the ports of Boston and Gloucester, Mass., Portland, Maine, and Seattle, Wash. (published monthly); catch of mackerel in the North Atlantic fishery; cold-storage holdings of frozen and cured fish and amount of fish frozen, which are furnished by the Bureau of Agricultural Economics (published monthly); production, consumption, and holdings of marine-animal oils of the United States and Alaska (published quarterly by the Bureau of the Census); production of canned fishery products and byproducts of the United States and Alaska; transactions on the sponge exchange at Tarpon Springs, Fla.; volume of fishery products handled at the Municipal Fish Wharf and Market, Washington, D. C.; and the volume of the United States foreign trade in fishery products, furnished by the Bureau of Foreign and Domestic Commerce.

The following statistical and marketing agents assisted in the collection and compilation of the statistical data: S. C. Denham, F. F. Dimick, W. H. Dumont, R. L. Greer, Wm. Hagen, Jr., V. E. Heffelfinger, H. J. Kumin, B. E. Lindgren, C. J. Robbins, V. J. Samson, C. B. Tendick, and J. L. Whitcomb.

The reader is especially referred to the section in the latter part of this report entitled "Statistical Survey Procedure," which gives in detail the methods employed in the collection of fishery statistics and other pertinent information.

FISHERY MARKET NEWS SERVICE

It is history that seasonal gluts and famines of fishery commodities in our markets have frequently resulted in disastrous financial losses to the fishery industries and much economic waste to the nation. Likewise, experience has shown that such conditions have been largely the result of inadequate market information available to producers, middlemen, and other interested parties. If there is to be economy

in marketing transactions, buyers must know where they can purchase supplies of fish most economically and producers must be able to sell to their best advantage. As a means of developing the more orderly and economic marketing of fishery commodities, the Seventy-fifth Congress provided funds for the establishment in the Bureau of Fisheries of a market news service for the commercial fisheries.

Essentially, this new service constitutes an exchange of market information between the fishermen or producers in fishing areas and the middlemen in terminal markets, with the Bureau of Fisheries acting as the service agency; that is, the agency for collecting and disseminating the news.

This new work was inaugurated during the year under the immediate supervision of Andrew W. Anderson, marketing specialist, and the general direction of Fred F. Johnson, Assistant Chief of the Division. The early part of the fiscal year was devoted to exhaustive studies of methods used by other agencies in their administration of market news services and of conditions inherent in the fishery industry which might tend to influence the types of services having greatest application and value.

New York City was chosen for the first fisheries market news office due to its importance as a terminal market and consuming center for fishery commodities from virtually every State wherein a commercial fishery is prosecuted. It also is an outstanding port of entry and terminal market for similar commodities from the maritime countries of the world. The annual consumption of fresh and frozen fish and shellfish in the New York metropolitan area is estimated at 400 million pounds, or about one-third of the total consumption of such commodities in the United States. Consequently, it was evident that current information on supply, demand, and prices in this market was of paramount value to the efficient conduct of the industry everywhere.

In November 1937 the market news staff proceeded to New York City and concentrated its attention on the development of the service there. The first daily report was published on February 14, 1938. This report, which is released in mimeographed form each day except Sunday and holidays, includes the following data covering the daily activities on the New York market: Volume of arrivals of fishery commodities by all types of carriers, separately enumerated by commodity classification and State, Province, or country of origin, with separate statements of the arrivals by express, rail freight, fishing craft, coastwise vessels, and transoceanic steamships; prices in both the salt-water and fresh-water markets; and movements of fish and shellfish into and out of cold storage. It further includes information on landings and prices at other ports where agents of the Bureau are stationed, such as Portland, Maine; Boston, Gloucester, Provincetown, and New Bedford, Mass.; and Seattle, Wash. Data received by telegram from the Seattle agent relating to landings of halibut at Prince Rupert, B. C., also are included. William H. Dumont, fisheries statistical and marketing agent, is in charge of the New York market news office.

Due to the outstanding importance of Boston as a producing port for fishery commodities, it was chosen for the second market news reporting office and the establishment of the service was started there early in 1938. The preliminary work in Boston was quickly com-

pleted and daily reports were issued beginning on May 26. The service at Boston is very similar to that in New York City. Detailed data are included in the daily reports on the landings of fish and shellfish at the Boston Fish Pier. These figures are separately enumerated by types of craft, fishing areas, and species. As in New York City, data also are included in these daily releases on prices, cold-storage movements, and arrivals at Boston by express, rail freight, fishing craft, and coastwise as well as transoceanic steamships. Data also are included on the landings and prices at other New England ports, at New York City, and at West coast ports. The Boston service further includes advance reports on certain fishery commodities en route to Boston, such as vessels with fares of mackerel passing through Cape Cod Canal, fish shipped by transporting vessels from Canadian ports, and express shipments clearing certain towns on the United-States-Canadian border in Maine. B. E. Lindgren, fisheries statistical and marketing agent, is in charge of the fishery market news service in Boston.

Studies are now in progress preliminary to the establishment of a market news reporting office in Seattle, Wash., and other offices will be established as time and facilities permit. Agents also will be stationed at other producing points to submit current market news data to the reporting offices.

The popularity of the fisheries market news service with members of the fishery industry and others has been demonstrated by the many commendatory letters received by the Bureau about the work from fishery associations, wholesale fish dealers, cold-storage and freezing companies, transportation agencies, financing companies, Federal, State and Canadian fishery agencies, fishermen, and reporters and editors of newspapers and periodicals.

It will be the Division's aim to continue a sound market news service and to incorporate in this service as much useful current data from important producing and consuming centers as can be accurately collected with available facilities. Furthermore, every effort will be exerted toward speed in dissemination.

COOPERATIVE MARKETING

The work of the cooperative marketing unit of the Division, which is charged with handling matters relative to the administration of Public, No. 464, an act passed by the Seventy-third Congress, second session, authorizing associations of producers of aquatic products, was continued during the year under the direction of L. C. Salter, fishery economist.

Since its establishment in 1935, the cooperative marketing unit has been conducting investigations to determine as far as possible the cooperative status of fishery organizations in the United States and the nature and extent of their activities and has given personal assistance to groups of fishermen contemplating the formation of cooperative associations. As part of this program, a survey of fishery associations on the Pacific coast was begun in 1936. During 1937 this was extended to include the fishing areas of the Atlantic and Gulf Coast States. Along with this survey, as a companion study, the unit has continued its investigation relating to the financing of fishing enterprises throughout the major fish-producing areas of the country.

It has been found that, among fishermen and associations visited, there is widespread interest in the possibilities of advancing cooperative marketing activities. This interest has been evidenced further by many requests for the Bureau to give aid of an advisory character concerning operations and management, and financing problems. Wherever possible, such assistance has been supplied through correspondence, informative literature, or personal contact.

During the past year a form letter was sent to State marketing agencies of commercial fish-producing States, to learn the extent to which these agencies were engaged in fishery cooperative marketing work. Replies revealed that very little work of this nature was being done. It was indicated in some instances, however, that the organic law or subsequent acts of State legislatures provide that State marketing agencies might conduct work of this character, but that the lack of it in many cases had been due to failure of fishermen and their associations to request this type of assistance. Statements were made to the effect that if fishermen or their associations desired such assistance and suitable appropriations were made by the State, work in behalf of fishery cooperative marketing could be conducted readily.

At the request of the Director of the Extension Department of St. Francis Xavier University, Antigonish, Nova Scotia, the Bureau's cooperative marketing specialist attended the Fifteenth Annual Rural and Industrial Conference held at the university in August 1937 and delivered an address on fishery cooperative marketing in the United States. This conference was devoted to the discussion of social and economic phases of rural and industrial life of the Province of Nova Scotia, in which fishermen and fishery cooperative associations have played an important part. Following the conference, the Bureau's representative was given an excellent opportunity to study cooperative activity among the fisher-folk of Nova Scotia, and the adult education and extension work of the university in connection with its efforts to teach fishermen the principles of cooperative marketing and to help them organize and operate cooperative associations. At a specially arranged meeting, attended by the Bureau's representative, details of the history and development of the cooperative work in Nova Scotia were discussed, as well as present cooperative marketing activities and progress being made. At the close of the conference, arrangements were made for a group of the conference members to visit various fishing communities in Nova Scotia in which one or more cooperative projects were being conducted.

As a result of the address on fishery cooperative marketing in the United States delivered at St. Francis Xavier University, Rev. E. A. Kerr of St. Michael's Parish, Ridge, Md., who attended the Annual Rural and Industrial Conference, requested the Bureau's assistance in connection with proposed cooperative activities contemplated by a group of pound-net and oyster fishermen of his parish. In compliance with this request, three representatives of the Bureau attended a meeting of the fishermen at Ridge, on October 14, 1937, for the purpose of discussing with them plans which they had been considering for the organization of an association for the cooperative marketing of their fishery products. Our representatives outlined the work of the Bureau relating to fishery cooperative marketing activities; discussed the principles, functions, and operations of fishery cooperative associations; and offered advice and suggestions to enable this group of

fishermen to become thoroughly familiar with the functions of cooperation before attempting to solve their local problems by this method. Later, one of the Bureau's technologists assisted the group in solving certain fishery processing problems.

Direct assistance also was given to a group of fishermen requesting assistance in the formation of a cooperative plan for the selling of shrimp at Thunderbolt, Ga. The Bureau's cooperative marketing specialist met with the group and later drew up a working agreement enabling these fishermen to operate cooperatively to sell their shrimp in an unincorporated manner until such time as sufficient funds would become available to properly organize and operate a cooperative marketing association.

At the meeting of members of the fishing industry at Atlantic City, N. J., in February 1937, members of the Bureau led a round-table discussion in which the work of the Bureau pertaining to fishery cooperative marketing was explained. Information also was supplied regarding what had been done among fishermen themselves in the United States in the way of cooperative activity.

Aid and assistance also was given to the Southern New England Fishermen's Association, Mystic, Conn., in June 1937, as to methods for improving markets for fishery produce.

In order to correlate the Bureau's cooperative marketing work with that of other agencies, our cooperative marketing specialist attended the meeting of the American Institute of Cooperation, at Ames, Iowa, in June, where he participated in round-table conferences concerning cooperative marketing and purchasing. Considerable interest was shown by this group in the work of the Bureau relative to the cooperative marketing of fishery products and mutual plans were developed for current exchange of information on cooperative enterprise.

While in Iowa, our cooperative marketing specialist conferred with representatives of the Iowa Conservation Department at their request, concerning the possibility of developing a plan for the cooperative marketing of carp and buffalofish taken in Iowa and adjoining States. These fishes are not highly prized in these States and, in an effort to rid their waters of them, the States have various contractual arrangements with the commercial fishermen. It was believed that if some type of cooperative marketing arrangement could be developed among those States that greater revenue could be derived from the sale of these fish.

In the spring of 1937 two bills (H. R. 6039 and H. R. 7309) were introduced into the United States House of Representatives, by Congressman S. O. Bland of Virginia, proposing the establishment of a fishery credit corporation for lending funds to fishermen's associations organized and operated in accordance with Public, No. 464, mentioned previously, and for the establishment of administrative agencies in connection therewith. Hearings on these bills were held on June 29 and July 16, 1937, before the Committee on Merchant Marine and Fisheries of the House of Representatives but at this writing the Congress has not yet acted on these bills.

The proceedings of these hearings have been published under the title "Fishery Credit Act, Hearings before the Committee on Merchant Marine and Fisheries, House of Representatives, Seventy-fifth Congress, First Session, on H. R. 6039 and H. R. 7309."

On December 31, 1937, Mr. Salter resigned from the Bureau to accept employment as a cooperative specialist with the Tennessee Valley Authority, Knoxville, Tenn.

TECHNOLOGICAL INVESTIGATIONS

Improvement of quality and increase in economic value of the products of our fishery industries constitute the goal toward which our technological investigations are directed and are constantly striving. The most modern tools of the various applied sciences are used in accomplishing these practical ends. This is conservation of a natural resource in its broadest and most effective meaning. For instance, it is comparable to the efforts of agricultural science in aiding farmers to make the most complete and valuable use of corn and cornstalks. In recent years much has been heard of a movement among scientists, known as the farm chemurgic. In a practical sense, this means teaching the farmer to direct the surplus products of his land, after food requirements have been met, to the factory as a source of supply of raw materials in the manufacture of industrial or nonfood products. In other words, the purpose of this movement is to bring agriculture and industry closer together and to make the farm a source for industrial raw materials. Likewise, fishery technology is serving not only to make more types of food available from the sea, but also is serving as the "sea chemurgic" to the "fishers of the sea," in teaching them to make valuable industrial commodities from fishery products, after primary food requirements have been met.

While our fishery technological studies have been of great value to the domestic fishery industries in increasing productive capacity and creating new wealth for the American people, their value to our domestic economy does not end there, for other American industries also are making great use of the results of our technological work. Many of these latter industries are consumers of raw materials produced by American fisheries and they follow our investigations very closely. At times, some have sent their technicians to our field and Washington laboratories where they have conferred with our technologists to keep abreast of the latest research developments. Following these contacts, some of these industries have applied the results of our researches to the manufacture of their products.

For instance, in 1919, the Bureau of Fisheries pioneered in the development in this country of quick-freezing methods in the preservation of a food product and has continued researches in the frozen food field ever since. Other food industries have been quick to grasp the significance of this work and now the quick-freezing of fruits, vegetables, and meats has become one of our major industries.

In another instance, the Bureau pioneered in searches for new sources of vitamins A and D and found that the oil from the livers of many species of fish are potent in these vitamins. Heretofore, only the livers of cod were thought to be useful for this purpose. The drug industry took advantage of this work and now produces many thousands of gallons of oil high in vitamins A and D from fish livers and fish viscera which formerly were discarded by the fishermen at sea. Likewise, our researches on the value of fish meal for feeding domestic animals have been of great value to the feed industry of this country.

A few years ago, the Division's technologists developed a smoke-house for curing fish which automatically controlled the temperature, humidity, and volume of smoke. In semicommercial operation, this produced a product which had a pleasing appearance and taste and one which was a considerable improvement over the usual smoked fish product prepared by "rule-of-thumb" methods. Many members of the fishery industry made use of this work and are now producing a better smoked fish product than heretofore. It has recently come to the attention of the Bureau that the results of this work are also being applied to the commercial smoking of meat products by the meat packing industry.

Our technologists are now conducting a cooperative investigation with a company interested in the temporary chemical preservation of fishery products until they can be concentrated at a central point for conversion into useful byproducts. The results of this work have been applied commercially to the preservation of various types of fish and fish products. In addition, the renderers of byproducts of the meat industry have taken advantage of this development to their economic benefit.

Several years ago, researches of the Bureau revealed that fishery products as a class are higher in iodine than most foods from land sources. As is well known, iodine is a mineral essential in the diet of man and animals. The fishery industry made considerable use of this knowledge attained by the Bureau to promote the increased consumption of aquatic foods. In addition, the salt industry utilized the scientific facts and now markets a product known as iodized table salt which is the usual salt to which a small amount of iodine has been added.

LABORATORIES

During 1937, the Division carried on its technological studies under the direction of Dr. J. R. Manning, senior technologist, at its laboratories located in Washington, D. C., College Park, Md., and Seattle, Wash. In addition, certain cooperative investigations were conducted by members of our technological staff in the laboratories of the University of Maryland, and Maryland State Agricultural Experiment Station at College Park, Md.; the University of Washington, Seattle, Wash.; and Washington State College, Pullman, Wash.

Construction of the small technological laboratory building in Seattle, Wash., referred to in last year's report, was completed. Heat, light, power, and plumbing facilities were installed and a greater portion of the Bureau's experimental equipment was set up in readiness for operation. Actual experimental work was undertaken shortly after January 1, 1938.

The building was designed to provide facilities for setting up experimental machinery and equipment necessary in investigating methods for preserving and utilizing fishery products. It is of frame construction, 26 feet wide and 40 feet long. The walls of wood are 11 feet high and are planned for future brick veneer. The concrete floor slopes to a center drain. The standard equipment includes a 10-horsepower, high-pressure, oil-fired steam boiler, a steam-jacketed dryer, vacuum pump and condenser, an hydraulic press, a filter press, three centrifugal separators, a hammer mill, an attrition mill,

an iron mill, a Wiley mill, a bone cutter, a refrigeration machine and cold storage cabinet, and miscellaneous jacketed cooking kettles. These are further supplemented by recording instruments and miscellaneous experimental equipment developed in the course of investigative work. The laboratory has both hot and cold water, a large wash sink, complete lavatory fixtures, and will be heated by an extended surface steam heater. All motive power is by electric motor, either direct or by line shaft, and adequate light, power, water, and gas outlets are provided around the laboratory. This building is a valuable addition to the Bureau's facilities for carrying on technological investigations and will permit semicommercial work heretofore impossible at the Seattle laboratory.

During 1937 our technological investigations in general were delayed or suffered from lack of suitable and sufficient space. Particularly was this true at our technological laboratories at College Park, Md.

PRESERVATION OF FISHERY PRODUCTS FOR FOOD

Studies during 1937 in the preservation of fishery products for food were conducted in the Bureau's technological laboratories at College Park, Md., Washington, D. C., and Seattle, Wash. The investigations in the College Park Laboratory were carried on under the supervision of James M. Lemon, technologist in charge, assisted by W. T. Conn, assistant technologist; S. R. Pottinger, junior technologist; M. E. Stansby, junior chemist; Joseph F. Puncochar, junior bacteriologist; William B. Lanham, Jr., junior chemist; Willis H. Baldwin, Hillman C. Harris, L. F. Ortenzio and C. E. Swift, research associates and student assistants; in the Seattle laboratory under the supervision of Roger W. Harrison, technologist in charge, assisted by Robert E. Silver, junior chemist; Charles Butler, William Clegg, Louis Simenson, Marie Sater, and Rhea Waterberry, chemists, assigned to our laboratory by the Works Progress Administration; and Leslie Lowen, Neil Nellis, and Robert Rucker, research associates and student assistants; and in the Washington laboratory by Norman D. Jarvis, assistant technologist in charge of experimental canning investigations, and Agnes I. Webster, fish cookery expert.

ELECTROMETRIC TESTS FOR DETERMINING THE FRESHNESS OF FISH

Several years ago an electrometric method or test for determining the relative freshness or degree of quality of fresh haddock was developed by M. E. Stansby and J. M. Lemon of our technological staff. During the ensuing years these men have been engaged in perfecting this method and in extending its application to the determination of the quality of fresh cod and pollock. In the meantime, as stated in the 1936 Division report, considerable interest was aroused by the industry in the possible commercial application of this test. In the original development of the method, the apparatus was designed for the testing of not more than four samples, simultaneously. This was one of the difficulties which was encountered when attempts were made by one of the large fishery producers in 1936 to use the test in commercial practice. At the request of this firm, and with its cooperation, the Bureau detailed M. E. Stansby to work with technologists of the

firm for the purpose of designing an apparatus which could be used commercially and which would enable an operator to make a greater number of tests simultaneously. Mr. Stansby was engaged in this cooperative detail from July 15, 1937, until the end of the year and, as a result of this work, designed equipment which can make determinations upon 10 samples of fish at one time. Thus, it is possible for the firm to make very rapid tests for the freshness of fish purchased, by means of this new apparatus, without delaying their packing activities. Ordinarily, 15 to 30 minutes were required for testing one sample. However, with the new apparatus, it is now possible for the operator to run the 10 samples in the same length of time and the test is now rapid enough to be used in the ordinary commercial control laboratory. The design of the apparatus is also quite simple and it is easy to manipulate. After a little practice an operator, without advanced scientific training, can obtain excellent results. At the present time this equipment is being used by the firm, in whose laboratories it was developed on a commercial basis, for the selection of fish which are to be used in packs of frozen products.

STUDIES OF RANCIDITY IN FISH

For the past several years we have studied the causes of rancidity in various fishery products and have worked on methods for its prevention which might have promise of commercial application. This work has been done in cooperation with the Musher Foundation, Inc., New York City, by research associates employed by the Foundation and stationed in our laboratories both at College Park, Md., and Seattle, Wash.

Several phases of this work which were conducted at our laboratories at College Park and which were described in last year's report, were completed and the results published in the following reports: "Oat Flour as an Anti-oxidant in the Salt Mackerel Industry," by J. M. Lemon, M. E. Stansby, and C. E. Swift, *Food*, vol. 6, No. 71, pages 441-443, August 1937, 33 Tothill St., Westminster, London, S. W. 1, and *Food Industries*, vol. 9, No. 10, October 1937, McGraw Hill Publishing Co., New York, N. Y.

Other phases of this work were conducted in our Seattle laboratory where studies were made by the research associate of the Foundation of the effectiveness of cereal flours and cereal flour extracts in preventing the development of rancidity and the destruction of vitamin A in fish oils and fish liver oils, and the usefulness of these materials in preventing deterioration in other preserved fishery products. As a result of this work, it was found that cereal flours and their extracts have a mild antioxidant action on these products. In the case of fish oils and fish liver oils the effect was due to retarding the rate of oxidation rather than preventing it for any extended period. In the case of the vitamin active oils, vitamin A destruction corresponded with autocatalytic oxidation; therefore, the cereal flours did not materially increase the period before destruction began but decreased the rate of destruction. On the basis of organoleptic examination, treated oils appeared to be less rancid than untreated oils with a similar degree of oxidation as shown by the peroxide test.

When cereal flours were dusted on dressed salmon or sardines just prior to canning, or the extracts were sprayed on the fish or in the can,

the canned products in general had a less pronounced odor and flavor during early storage but the advantage seemed to disappear soon.

The addition of cereal flours to brine used in the preparation of mild cured and kippered salmon did not show any detectable improvement in the quality of the product. On the other hand, canned Maine sardines prepared from fish treated with salt and oat flour in the hold of the boat during transit to the cannery showed some improvement over those to which salt alone had been added.

Spraying cereal extract on the surface of spiced herring resulted in the treated samples having a definitely better odor and flavor than the untreated samples after extended storage.

Studies on these and other aspects of the possible utility of the cereal flours is being continued by the research associates of the Musher Foundation.

STUDIES OF LACTIC ACID AS A POSSIBLE INDEX OF DECOMPOSITION IN FROZEN FISH

In order to simplify understanding of the problem, decomposition of fish might be classified into three general types. These are: (1) Enzymatic decomposition, or the action of enzymes, already present in the fish when alive, and which begin to break down the more complex compounds in the fish into simpler substances; (2) the deterioration or oxidation of the oil in the fish; and (3) bacterial decomposition.

When fish are frozen the bacterial action is arrested, since the bacteria are almost entirely killed at freezing temperatures. However, the other two types of decomposition in fish proceed but at a much slower rate than if the fish were not frozen nor held at low temperatures. The problem of rancidity or oxidation in fish is discussed elsewhere in this report. Therefore, we are concerned here with enzymatic decomposition. It is known that one of the indications of the action of enzymes in fish, immediately after death, is an increase in the formation of lactic acid. Since lactic acid is a definite chemical compound and its quantities in fish can be accurately determined by analysis, our technologists decided that the amounts of lactic acid formed in fish at various stages of decomposition might be used as a reliable index of the progress, rate, or stage of decomposition or, to put it another way, it might be an accurate means of measuring the relative freshness of fish, somewhat similar to the use of the electro-metric method for determining the relative freshness of fish, discussed elsewhere in this report.

Therefore, during the summer of 1937, Willis H. Baldwin, graduate student assistant, was temporarily assigned to duty at the Maryland State Marine Biological Station at Solomons Island, Md., for the purpose of procuring and freezing samples of fish to be used in a study of this project. It was necessary for the investigator to obtain these fish himself so that he would have a complete history and control of the fish from the time they were taken from the water until they had passed through the progressive stages of chemical changes accompanying decomposition to a point where they would be no longer fit for use as food. In some instances, fish were actually taken from the water alive and killed or were frozen, while alive, and the amounts of lactic acid determined in each sample immediately after freezing. These samples were then brought to our technological laboratory at College

Park where they were stored in a low temperature refrigerator and analyzed for lactic acid content at regular intervals during the entire period of storage.

Since this work was not begun until late in 1937, we are not in a position to report any definite conclusions at this time. However, it was found that fish which were frozen alive, and others which were frozen in rigor, had a lower lactic acid content after storage of 4 months than fish packed fresh in ice for 3 days, but still in rigor and then frozen and held in storage for 4 months. Still higher percentages of lactic acid were shown in fish, not kept in ice, but frozen 3 days after death and on which determinations were made after 4 months of storage. It is possible that this study may not only yield another reliable index of decomposition but it may also reveal data which might enable our technologists to develop means of preventing or arresting enzymatic decomposition in fish.

IDENTIFICATION OF CANNED SALMON

The utility of a test for identifying canned salmon according to species was discussed in last year's report, and certain data were given which suggested the possibility of identification on the basis of the refractive index and color of the free oil in the can. During the past year our technologists examined oil samples from approximately 1,000 cans of salmon which were selected as representative of the 1936 season's pack, and found that there was considerable overlapping of the refractive index and color of the oil between the species. This, therefore, precludes the use of this test as an infallible means of identifying canned salmon.

CHANGES IN THE COMPOSITION OF PINK SALMON (*Oncorhynchus gorbuscha*)

In 1936 the Bureau published Investigational Report No. 33 entitled, "Physical and Chemical Changes in the Pink Salmon During the Spawning Migration," by Frederick A. Davidson, Division of Scientific Inquiry of the Bureau, and O. Eugene Shostrom, National Canners Association, Seattle, Wash. Since the pink salmon is one of our most important species of food fish, used almost entirely for canning, our Seattle technological laboratory at the beginning of the salmon season in 1937, and with the assistance of chemically trained personnel supplied by the Works Progress Administration, undertook a further study of individual fish of each sex as to gross composition, such as percentage of fat, ash, protein, moisture, water soluble nitrogen compounds, heat coagulable nitrogen compounds, free amino nitrogen, copper precipitable nitrogen, and phosphotungstic acid precipitable nitrogen. These analyses for gross composition indicate that while the fat content decreases and moisture content increases, during the course of the spawning season, there is very little if any apparent change in the composition or nature of the protein until the fish reach fresh water. In addition, purified protein material was prepared from the samples and reserved for subsequent quantitative measurement of certain essential amino acids.

CANNING AQUATIC PRODUCTS

During 1937 the series of experimental packs in the study of home canning methods was completed, and packs previously prepared were examined to gather data for a final report on improved methods for home or noncommercial canning. Data obtained during the year indicated that such fresh-water varieties as the carp, hitherto regarded as unsuitable for canning, could be prepared as a canned product of good quality, by home or noncommercial canners, thereby opening the door for wider utilization and conservation of fishery resources in the interior of the country, as well as increasing and diversifying the supply of food for home consumption.

Studies on the development of a commercial method for canning the blue crab of the Atlantic and Gulf coasts were continued with series of experimental packs of crab creole, crab gumbo, crab soup (Norfolk style), crab cakes, and crab sandwich paste.

In addition, many experiments were made to prevent discoloration of crab meat packed without other food ingredients. Considerable progress has been made toward the solution of this latter problem, as packs have been prepared which show no discoloration after six months of storage and have the color and flavor of fresh crab meat. The method is now being tested on a large commercial scale at various fish-canning plants along the Atlantic and Gulf coasts and the results of this work will be reported upon later.

In addition to the above mentioned products, further experimental packs prepared during 1937 have included fish chowder, clam chowder, scallops, whiting, California pilchard (sardine), Dungeness crab, Maine sardine, and herring (alewife) roe. The results are not yet available.

The survey of present and modern commercial methods for the canning of fish and seafoods was continued. Field work was carried out in the Chesapeake and New England areas. Data were gathered on commercial methods of canning alewives and alewife roe, finnan haddie, fish balls, fish cakes, fish flakes, Atlantic mackerel, sturgeon, shad, soft clams, mussels, crab, lobster, Maine sardines, pet food, clam chowder, fish chowder, fish roe, anchovies, smoked herring, spiced herring, smoked salmon, salmon caviar, and salmon bait eggs.

At the request of the State of Virginia, our technologist in charge of experimental canning was detailed to make a study of the herring roe canning industry in that State, with a view to improving methods, and to draw up tentative grades and regulations for a State voluntary inspection system of canned herring roe. As a result of this work, a State inspection system is being set up for this purpose adopting recommendations made in this study.

BACTERIOLOGICAL STUDIES

Our bacteriological investigations during the past year were carried on by Joseph F. Puncochar, junior bacteriologist; Harold E. Crowther, research associate; and Louis F. Ortenzio, graduate student assistant. Most of our bacteriological problems are closely integrated phases of specific problems or projects in the preservation of fishery products for food or the preservation of fishery byproducts, or closely coordinated studies of spoilage problems. Thus, bacteriological examinations are

made of the experimental packs of canned fishery products to determine which processes produced sterility; bacterial counts are made on samples used in our studies on the development of indices of relative freshness or of decomposition; the use of ultraviolet rays in killing bacteria; determinations of the value of various chemical preservatives in preventing or retarding bacterial spoilage in fishery byproducts; and other miscellaneous bacterial control problems.

STUDIES OF ULTRAVIOLET RAYS IN KILLING BACTERIA

Since the reduction of the presence of bacteria in fish is essential to the preservation of fish, any device or method which can be found to bring about this accomplishment is vitally important to the industry and to the consumer. According to information which we have received, resulting from studies made on other food products, the use of ultraviolet light rays has been beneficial in reducing bacteria in milk, meats, bread, etc., and in improving the keeping qualities of these foods. Therefore, late in 1937, our bacteriologists began a study of the effect of these ultraviolet rays in reducing the bacterial count of various fishery products. As a result, we have found that the rays will kill marine bacteria and we hope to work out a practical and commercially feasible application of this method in the treatment of fishery products.

STUDIES IN THE HANDLING OF FRESH OYSTERS

Late in 1937, at the request of the Oyster Institute of North America, and in cooperation with that organization, a program for studying the handling of fresh oysters was undertaken. Louis F. Ortenzio, a member of the Division's technological staff, was assigned to the study of this problem. While this problem has certain chemical aspects, the major portion of the investigation is a bacteriological one. The work has not progressed to a point where recommendations in the improved handling of oysters can be made.

Briefly, the following experimental procedure is being used. Bacterial counts to measure the rate of bacteriological decomposition and determinations of the pH to measure the rate of chemical decomposition are being made on commercial shipments of oysters. This may lead to the development of a test for determining the relative freshness of oysters as well as to the development of methods for preventing or retarding spoilage of fresh and frozen oysters.

PHARMACOLOGICAL STUDIES

The role of minerals in foods and in feedstuffs for farm animals is becoming of increasing importance. Not only have certain minerals been found to be essential in nutrition, but there is need for a better understanding of other physiological effects they may have on the animal organism. With this in mind, the Bureau has continued its studies on certain minerals, naturally occurring in fishery products.

THE FLUORINE CONTENT OF FISHERY PRODUCTS

The fluorine content of foods presents a major problem in nutrition since the discovery that fluorine is responsible for mottled enamel of teeth. Therefore, during 1937, our technological staff undertook a

study of the fluorine content of various fishery products and the effect of this fluorine, as it naturally occurs in some fishery products, in the metabolism of the animal organism. A series of so-called "balance" experiments were started, in our College Park laboratories, to determine the intake and excretion of fluorine in rats fed a diet of canned fish, containing about 8 parts per million of fluorine. Preliminary work on this problem indicates that there were no apparent toxic symptoms in the experimental animals after a test period of 12 weeks, and the consumption of fish was very satisfactory.

MANUFACTURE OF FISHERY BYPRODUCTS

The utilization of waste for the manufacture of byproducts is becoming of increasing importance, probably more so in the fishery industries, than in other food industries. It has been estimated that the value of fishery byproducts represents about 15 percent of the total value of all fishery products in the United States. When we study the diversification of these byproducts and their uses, they loom into even greater economic importance than their relative volume would seem to indicate. Fishery byproducts furnish raw materials or finished products for such highly important consuming industries as the drug, paint and varnish, soap, and feed industries. Accordingly, our technologists are giving increasing attention to the conversion of fish waste and other waste materials resulting from our fishery harvest into useful byproducts. During 1937, investigations dealing with the preservation of fishery byproducts were carried on in the Seattle technological laboratory under the supervision of Roger W. Harrison, technologist in charge, with the assistance of Andrew W. Anderson, assistant technologist (subsequently transferred to the market news service); Robert E. Silver, junior chemist; and Leslie Lowen, Neil Nellis, and Robert Rucker, research associates and student assistants; and in our College Park technological laboratory under the supervision of of James M. Lemon, technologist in charge, with the assistance of S. R. Pottinger, junior technologist; M. E. Stansby, junior chemist; Joseph F. Puncochar, junior bacteriologist; and Harold E. Crowther, R. H. Flowers, and C. E. Swift, research associates and student assistants.

UTILIZATION OF SALMON-CANNERY TRIMMINGS

In previous reports we have discussed the economic importance of the waste accumulated during the preparation of salmon for canning and the progress being made in the Bureau's studies on methods of utilization. During 1937, we had hoped to extend this work to pilot plant operations but due to unforeseen delays in getting the new technological laboratory building in Seattle, Wash., in readiness such studies were necessarily postponed and the investigation was confined to work permitted by the facilities of the chemical laboratories.

In view of this, a rather extensive survey was made on the chemical and physical properties of the oil obtainable from the various components of salmon waste and from the total waste of the five species of salmon from the principal fishing areas of this fish in the United States and Alaska. As indicated in our last report, it is possible to obtain oils having quite widely varying properties. The chemical studies on these samples were continued during the past year for the

purpose of obtaining further data on their composition. The studies included the estimation of the percentages of saturated and unsaturated fatty acids and their mean molecular weights. These data are being included with the former data in report form.

In certain localities in Alaska the problem of utilizing salmon cannery trimmings is primarily one of how to overcome the seemingly prohibitive situation of having a season of operation of not more than 30 days during the year. One means of accomplishing this would be to broaden the scope of operations to include other types of fish which are available over a longer period of time which would permit a byproducts plant to operate over a longer season. In this connection our technologists began studies on the utility of other fishery materials which might be available for supplementing the supply of salmon cannery waste. An examination of samples of atkafish, said to be abundant in the Bristol Bay area, indicated these fish would yield at least 30 gallons of oil per ton of raw material and the resultant meal would contain over 70 percent protein. Except for color, the properties of atkafish oil were quite similar to those for red salmon oil. Greater attention might also be given to the utility of these fish as a source of human food.

Since beginning our investigations on the utilization of salmon cannery waste, definite progress has been made by the salmon-canning industry toward more complete use of the waste. A certain degree of this progress can be attributed to the advisory service being supplied by the Bureau's technologists on the basis of their investigational work.

FISH-LIVER OIL STUDIES

Methods of extraction.—Because of the sustained interest in fish livers as sources of highly potent vitamin active oils, the Bureau has continued to give considerable attention to developing methods for the more economical extraction of oil from these livers.

In last year's report reference was made to the development of a simple method of oil extraction which had been demonstrated to be applicable to halibut and "lingcod" livers. This involved a special mechanical disintegration of the liver, conversion of the liver tissue into a soluble and nonheat coagulable condition, and separation of the oil from the solution by centrifuging. An application for a public service patent on the method is on file at the United States Patent Office.

During the past year the above method of extraction was found to give satisfactory results with swordfish livers but was not directly applicable with uniform success to domestic tuna livers. This is because the tuna livers are normally of very low oil content and the active lipolytic action in the liver during the period required to bring the catch to port results in there being only a very small quantity of neutral glyceride oil available for recovery. This difficulty, however, can be overcome by mixing a quantity of foreign oil with the livers prior to subjecting them to the extraction process. Experiments on salmon livers and salmon waste during 1933 had demonstrated the vitamin solvent action of fish oil and the experiments on tuna livers during the past year demonstrated the increased efficiency when using the foreign oil in connection with the process developed for halibut livers. The method is applicable for producing oils

approaching the normal concentration of the oil in the liver or it may be used in fortifying the foreign oil to any desired degree below this potency.

Vitamin testing methods.—For a number of years the antimony trichloride color reaction has been a popular method for estimating the vitamin A potency of fish-liver oils and finds usage as a control test. However, the method has been subjected to such a great amount of criticism that many investigators consider the test to carry no degree of reliability. In spite of this criticism, there are others who have found the method useful and continue to use it, taking cognizance of its reported limitations. One of the principal criticisms of the method is that there is no consistent relationship between Blue value (colorimetric method) and Biological value as determined with rats. In this case, however, the data are generally viewed from the standpoint of a direct comparison.

During the course of our liver oil studies, Blue unit values have been obtained on a relatively large number of liver oil samples having vitamin A potencies varying between 5,000 and 200,000 U. S. P. units per gram as determined by biological assay. In studying these data, there was found to be a definite power relationship between the two types of values. In applying this correction it has been possible to increase the accuracy of the test.

FISH OILS IN PAINTS

During the past year, as a result of conferences of our technologists with members of the industry, there was a greatly increased use of fish oils in paints. Not only did this increase extend to the lower grades of paints, but, for the first time in the history of the paint industry, some of the leading paint manufacturers made extensive use of fish oils as ingredients of the higher priced paints and this fact was widely advertised in trade journals. This development can be attributed largely to improvements in the refining of fish oils by some of the leading refiners of the country, with the cooperation and assistance of our technologists.

STUDIES ON FAT IN FISH MEAL

As fish meals have become more widely used and their properties more thoroughly understood, the question of fat content has likewise become an important consideration. The reason for this is that the amount of fat present is an indication of the proportion of the material which may be subject to oxidative deterioration. Consequently, low fat content meals are preferred by some consumers and sale may be predicated upon this factor. Unfortunately, however, the fat, or more correctly the oil, becomes less soluble in normal solvents when oxidized, and oxidation may, therefore, lead to an apparent decrease in fat content. Furthermore, accepted practice for determining fat is not uniform. The unsatisfactory nature of this situation is obvious because a meal reported as having a low solvent extract value may have reached this condition as a result of oxidative deterioration.

For some time the Bureau has appreciated the need for tests which will clarify this confusing condition, because such information would not only lead to more satisfactory methods of control in marketing

fish meal but would also provide useful means in furthering study of changes taking place during storage and the effectiveness of improved storage practice.

During the past year attention has been given to determining the relative amounts of extractable material removed by different solvents from fish meal soon after being prepared and after extended storage under conditions known to lead to oxidative deterioration. Sixteen solvents were tested on two separate types of fish meal. The most significant aspect of the data secured on these tests illustrated the widely differing effectiveness of individual solvents and the fact that effectiveness is closely related to chemical structure. This will materially facilitate the work contemplated during the ensuing year.

In addition to the studies mentioned above, which were conducted in the Seattle laboratory, the Bureau's nutrition laboratory at College Park, Md., has been studying the physiological effect of the development of rancidity or oxidative deterioration in the fat of various fish meals, and other chemical changes, in the feeding of both white rats and baby chicks, as laboratory animals. This latter investigation particularly emphasizes the effect on these animals of any physiological and chemical changes which may be induced under varying conditions of manufacture, handling, and storage, which may cause the development of rancidity of the fat or the partial digestion of the protein in these fish meals. These studies have not progressed to a point where any conclusions can be reported.

CHEMICAL PRESERVATION OF FISH AND FISH WASTE

Several years ago the Bureau established a cooperative arrangement with the Aquacide Co., Washington, D. C., for the conduct in the Bureau's College Park technological laboratories of a study of methods of chemical preservation of fish and fish waste. At many points in the United States and in Alaska there are relatively small accumulations of fish waste or waste fish, not sufficient to justify the installation of machinery or mechanical equipment for the production of byproducts, but sufficiently large to merit the development of cheaper methods of utilization. The problem has been attacked from two standpoints. One is the temporary chemical preservation of the waste until it can be transported to some central point for more complete mechanical reduction and the other is outright chemical preservation or reduction for use as fertilizer stock, etc.

As in 1935 and 1936, the Aquacide Co., during 1937, employed and stationed in our laboratories Harold E. Crowther, R. H. Flowers and C. E. Swift, research associates. Already, results of considerable practical value have evolved from this program of cooperative research. A chemical solution developed by the above company has been tested on various types of fishery waste and has been shown to be very effective in its preservative qualities. In recent years its effectiveness has been improved by numerous tests on fishery waste. One very important commercial possibility, as a result of this work, is the temporary chemical preservation of cod livers and other fish livers at sea until these livers can be transported to a central plant for the extraction of the oil. The widespread application of this method has promise of saving from spoilage many fish livers which now do not reach the plant quickly enough for the extraction of an oil of good

quality. At the present time only a relatively small part of the catch of haddock and cod is made close to shore, and for this reason the method may find use as a temporary means of preservation for the livers yielded by the fisheries for these species.

During 1937 one of the research associates working on the chemical preservation of fish waste was stationed at Boston, Mass., to direct the handling and preservation of fish livers at sea. Under his direction many types of chemical preservatives were tested under practical conditions. The preservative solutions were sent to sea on fishing vessels and fresh livers were placed in these solutions by the fishermen. The livers were then shipped to the Bureau's College Park laboratories, where they were inspected, rendered, and the relative quality of the oils determined. By these experiments there was developed a very effective preservative chemical solution which stopped bacterial and enzymatic decomposition and kept the oils in their original fresh condition. However, rendering methods in ordinary commercial use were not easily adapted to these preserved livers. Therefore, a new "flotation" process was developed which results in high yields of oil, oils of high quality, and economy of operation. The details for large scale application for these preservative and rendering processes are now worked out on a semicommercial basis and the commercial usefulness of the work seems assured.

As a part of this cooperative program our nutrition laboratory is making an extensive study of the vitamin A and D content of the various organs of the viscera of cod, cusk, hake, halibut, haddock, pollock, and other species preserved with the chemical formulas.

NUTRITIVE VALUE OF AQUATIC PRODUCTS

There is a great need for more complete information concerning the food value of various commercially important fishery products. There is also considerable demand for this information, not only from the industry, but from the consuming public. There are notable gaps in this information because scientific studies have not covered all of these fishery products, and there is only partial knowledge of the nutritional properties of some of the others. The lack of this information hinders dietitians and home economics experts in determining the most satisfactory use of fishery products in the diet. The food and drug industries need, and have requested, information on the nutritive value of aquatic products. The feed manufacturer and the farmer require more complete data on the qualities of fishery products for animal feeding. Therefore, it is highly important that our technological staff obtain, as soon as possible, more complete information on this subject, and at least fill in the important gaps in scientific knowledge concerning the unexcelled nutritional value of these products of the sea.

Furthermore, nutrition studies are necessary to properly evaluate our technological investigations on the improvement of existing methods and the design of new methods in the handling, utilization, processing, preservation, and storage of the great diversity of products of the fishery industries.

During 1937 investigations concerning the nutritive value of fishery products and byproducts were conducted in our College Park laboratories under the supervision of James M. Lemon, technologist in charge,

by Dr. Hugo W. Nilson, assistant pharmacologist; S. R. Pottinger, junior technologist; Charles F. Lee, junior chemist; William B. Lanham, Jr., junior chemist; Joseph F. Puncocochar, junior bacteriologist; and Willis H. Baldwin and Hillman C. Harris, graduate student assistants, with the cooperation of Professor M. H. Berry of the Dairy Department, Maryland State Agricultural Experiment Station; and in our Seattle laboratory under the supervision of Roger W. Harrison, technologist in charge, assisted by Charles Butler, William Clegg, Louis Simenson, Marie Sater, and Rhea Waterberry, chemists, assigned to our laboratory by the Works Progress Administration; and with the cooperation of Dr. J. S. Carver, Washington State College, Pullman, Wash.

VITAMIN CONTENT OF FISHERY PRODUCTS

As in former years, our nutrition laboratory continued assays of numerous samples of fish oils and fish-liver oils from different species for content of vitamins A and D, prepared experimentally in connection with the byproducts program of our Seattle laboratory. We also began, in cooperation with the Federated Scallop Producers Cooperative Association, determinations of vitamins A and D in scallop waste, but we had to discontinue this work before it was completed because the association and the scallop industry failed to continue its support in supplying samples in accordance with the laboratory schedule. However, preliminary studies indicated a higher vitamin A potency in scallop waste than we have found in the flesh of other species of fish or shellfish previously analyzed.

In a previous section in this report, some studies were discussed which were started in 1937 in connection with the use of ultraviolet rays in killing bacteria in fish. In addition to the value of these rays in reducing the bacterial count in fish so treated, preliminary analyses by the nutrition laboratory showed that the irradiation of haddock fillets by this mercury vapor lamp increased the vitamin D potency of the samples. If more complete data or further studies in this connection substantiate these conclusions, this discovery will have considerable commercial significance, as fish fillets or other edible portions of fish could be irradiated in the same manner as milk is now treated and sold by dairies at a premium as "vitamin D milk."

Recent discoveries in the chemistry of vitamins have shown that the substance which chemists originally classified under the term, "vitamin B," is really a combination of vitamins. This combination or substance is now known as the vitamin B complex. Newer knowledge of vitamins, being obtained by scientists every day, is gradually identifying the vitamins which make up this complex. This means that the interpretations of the results of nearly all of the previous analyses of vitamin B and vitamin G, which formerly was classed with vitamin B in fishery products and in other foods, must be modified in accordance with these more recent discoveries. Therefore, the Bureau's nutrition laboratory has found it necessary to devote a limited amount of time to the development or standardization of new methods of analysis for these vitamins, constituting the vitamin B complex, for application to fishery products. Studies of the vitamin B complex in oysters and in three types of canned salmon have been begun.

CHEMICAL COMPOSITION AND NUTRITIVE VALUE OF FISH PROTEINS

As was discussed in last year's report, technologists in the College Park laboratory began, during the latter part of 1935, a study of the composition and nutritive value of proteins in some of the commercially important species of fish and shellfish. This information has been desired by welfare authorities, physicians, dietitians, and others interested in nutrition and health. Protein, which is the basis of all diets of man and his domestic animals, is a very complex chemical compound and varies in biological or nutritive value according to its composition. To date our technologists have isolated and determined the amounts of cystine, tryptophane, arginine, histidine, and lysine in cod, haddock, sea herring, Boston mackerel, Spanish mackerel, croaker, mullet, shad, red snapper, halibut, lake trout, oysters, crabs, clams, and shrimp. In feeding experiments with laboratory animals, it was found that fish proteins were at least 90 percent digestible. It was also found that the proteins from fishery products were definitely superior to both casein and beef in promoting growth in the experimental animals, when fed in a diet in which the protein was a limiting factor.

The concentrates, extracted from the various species of fish and shellfish mentioned above, constitute a highly nutritious and attractive flour or meal which consists of about 95 percent protein and 3 percent mineral constituents. As it is almost a pure protein, it should have great possibilities as an ingredient of baby and invalid foods. Likewise, it should be well suited for making such bakery products as cookies and crackers. These concentrates could be made on a commercial scale from many species of fish, not now finding a ready sale, as well as from the edible trimmings of our common market fishes.

MINERAL CONSTITUENTS OF FISHERY PRODUCTS AND BYPRODUCTS

As has been stated previously, the mineral constituents of foods are being shown to be of increasing importance as the science of nutrition progresses. About 34 mineral elements have been identified in sea water, and nearly all of them have been found, in traces at least, in aquatic products. Among the minerals which have been shown to be of great importance in nutrition are calcium, phosphorus, iodine, copper, iron, manganese, and magnesium. In general, fishery products are excellent sources of these mineral constituents and superior sources of some of them, such as iodine. In order to determine the relative standing of various fishery products in these minerals, detailed analyses were made, during 1937, of the kinds and quantities of these mineral constituents in cod, haddock, mackerel, salmon (canned), shrimp, crab meat, and oysters.

FISH MEAL IN ANIMAL FEEDING

The Bureau's cooperative experiments with the Department of Poultry Husbandry at Washington State College, Pullman, Wash., were continued during the past year. This work has been concerned largely with the vitamin content of fish meals.

In earlier studies evidence was obtained indicating the practicability of producing fish meals containing sufficient vitamin D to

supply an adequate amount of this vitamin to the ration when the meals are included in normal quantity. In the present work attention is being given to the matter of vitamin retention, since the utility of fish meals must be based on their quality when fed, and this may mean after storage periods up to and exceeding 1 year.

The principal problem in storing meals containing any appreciable quantity of oil is to prevent oxidation changes in the oil which lead to the formation of undesirable rancid products and cause vitamin destruction. The investigation during the past year was designed to study the effect of cereal flours as antioxidants when incorporated with the meal during storage. The experimental samples, however, carried a much higher vitamin content than was anticipated and a proper level of diet was not determined during the time allowed for this particular work. The experiments are being repeated during the present year, and, in addition, attention is being given to the effectiveness of pelleting as a means of preventing deterioration during storage. When the meal is compressed into pellet form the tremendous surface exposed by the finely ground material is drastically reduced, air is excluded and only a limited opportunity for oxidation is permitted.

KELP MEAL IN ANIMAL FEEDING

One of the principal problems of the modern dairy industry, according to animal husbandrymen, is the irregularity in the reproductive capacity of dairy cows. Workers in dairy science have been looking for some means to arrest this condition through improvements in the ration of the dairy herd. Since it has been known for some time that certain minerals influence reproduction and lactation, in their search for dietary solution, the attention of dairy husbandrymen has been directed to so-called mineral feed supplements. Kelp meal, a dried and finely ground product of the giant kelp, a species of seaweed of the Pacific coast, is known to be an excellent organic source of certain minerals which have nutritional value. Dr. McCollum, of Johns Hopkins University, has shown that magnesium and manganese are important in reproduction and lactation in such laboratory test animals as white rats. Kelp meal is an excellent source of these two minerals. Therefore, during the past year, in cooperation with our technologists, Professor M. H. Berry, of the Dairy Department, Maryland State Agricultural Experiment Station, College Park, Md., inaugurated a series of feeding tests with dairy animals to determine whether the addition of kelp meal to these experimental rations would have any value in improving reproduction in dairy cattle. Because of the nature of the experiments and the time element involved, it is expected that at least 3 years will be required to obtain results on which any conclusions can be based.

FISH COOKERY STUDIES AND DEMONSTRATIONS

As stated previously in this report, there has been a great increase in interest on the part of dietitians, home economics workers, and others, in the nutritive value of fishery products and their importance in the diet of the American people. From this, it would naturally be expected that there would be a great need and a great demand for information on fish cookery. Therefore, during 1937, Agnes I. Web-

ster, of the Division's staff, continued her studies and practical demonstrations of fish cookery recipes. In addition to the developing and testing of new recipes in our fish cookery laboratory, Miss Webster also conducted practical demonstrations before home economics workers, housewives, etc., in New Brunswick, N. J.; Baltimore, Md.; and various points in the State of Florida.

During 1937, the Federal Surplus Commodities Corporation purchased a considerable quantity of surplus fish for distribution to persons on relief rolls in various parts of the country. In connection with the distribution of these fish, Miss Webster conducted practical demonstrations in fish cookery before relief workers, and others interested, at various points in the Midwest.

RESEARCH ASSOCIATES AND STUDENT ASSISTANTS

Because of the relatively small size of the Bureau's technological staff, and the rather broad field of research it must cover, it is only possible to undertake those problems which are of a fundamental nature and which promise to be of the greatest value to the largest number of persons, whose livelihood depends in whole or in part on the fisheries, and which are possible with the funds and personnel available. For this reason the Division cannot, with present facilities, attack problems of special or restricted interest affecting certain products, processes, methods, or industries. However, the Bureau has available, by congressional authorization and under an arrangement similar to that of other scientific Government bureaus, facilities for research associates and student assistants in its laboratories. The salaries and expenses of these employees are paid by the firms or groups who are interested in the problems on which they are working and the investigations are carried out under the supervision of the Bureau's technologists in its laboratories and under its control. Thus the Bureau provides these industries and groups with laboratory, consulting, and library facilities which, in most instances, cannot be obtained elsewhere.

Within the limits of its facilities, the Bureau also has opened its technological laboratories to research students who are pursuing courses in universities and who are selecting investigational problems in the fisheries as their major study. This may prove of special benefit to the industry as it brings its problems to the attention of a large group of research workers who in turn may spread interest to applied fishery research.

The following research associates and student assistants carried on investigations under the supervision of our technological staff during the past year:

In the College Park Laboratory, C. E. Swift, research associate, employed by the Musher Foundation, Inc., New York City, working on the problem of rancidity in fishery products and byproducts; Harold E. Crowther, R. H. Flowers, and C. E. Swift, research associates, employed by the Aquacide Co., Washington, D. C., working on problems in the chemical preservation of fishery byproducts; William B. Lanham, Jr. (part of the year), Willis H. Baldwin, Hillman C. Harris, and Louis F. Ortenzio, part-time graduate student assistants, employed by the Bureau of Fisheries and working on problems in the chemistry and metabolism of fish products, lactic acid as an index of decomposi-

tion in fish, and in the handling of fresh oysters; Ned Oakley and Roscoe Dwiggins, student assistants provided by the National Youth Administration through the University of Maryland.

In the Seattle technological laboratory, Leslie Lowen, research associate, employed by the Musher Foundation, Inc., New York City, working on the problem of rancidity in fishery products and by-products; and Neil Nellis and Robert Rucker, student assistants provided by the National Youth Administration through the University of Washington.

The details of the above work has been described in the preceding pages.

EDUCATIONAL AND CONSULTING SERVICE

In addition to the research activities described in this report, our economic and technological staffs conduct, along with their regular duties, an educational and consulting service for those interested in the fisheries. During the past year the demand for this type of service has increased. Many requests have been received from groups and individuals to demonstrate improved methods developed in our laboratories for the handling and processing of fishery products, for instruction in fish cookery, and for aid in improving various marketing practices. Insofar as our facilities have permitted, we have complied with these requests, endeavoring to offer assistance especially where the request has come from a large group or industry. However, we have not been able to comply with all of the requests received because of insufficient personnel and because of inadequate funds to provide for the travel expenses of the demonstrators.

Some of the educational services rendered are discussed or referred to in previous paragraphs of this report. In brief, this work has covered the fields of commercial preserving of fishery products, fish cookery in the home, and the marketing of aquatic products.

Another phase of this service has consisted in answering thousands of letters directed to the Bureau on fishery subjects and in supplying information to persons who have called at the Bureau personally. Many of the latter came from foreign lands to seek fishery information which might be useful in the conduct of the industry in their native country.

PUBLICATIONS OF THE DIVISION

During the calendar year 1937 the following publications were prepared and addresses delivered by members of the Division's staff. These do not include the monthly statistical bulletins of the landings of fishery products at Boston and Gloucester, Mass., Portland, Maine, and Seattle, Wash., nor the monthly reports on cold-storage holdings of frozen fish and quantities of fish frozen. The fishery reports and circulars may be purchased, at the prices shown, from the Superintendent of Documents, Government Printing Office, Washington, D. C. The statistical bulletins and special or S-memoranda are distributed free of charge upon request to the Bureau. The special articles may be obtained from the sources of publication.

Those wishing to receive copies of this report, and statistical bulletins as issued should request that their names be placed on the Bureau's mailing lists, Nos. 128 for the annual statistical report; 128a for general statistical bulletins; and 128b for monthly cold-storage

reports. Those desiring historical statistical data on the domestic fisheries for the period 1880 to 1929 should consult the report entitled "Fishery Industries of the United States, 1930," by R. H. Fiedler, appendix II to the Report of the United States Commissioner of Fisheries for the fiscal year 1931. Statistical information for the years 1930 to 1935, inclusive, may be obtained from the annual reports of the Division for the years 1931 to 1936, inclusive.

Part 2. FISHERY STATISTICS, 1936

GENERAL REVIEW

Based upon available statistics for 1936, there was a large increase in the catch of fishery products in the United States and Alaska as compared with that of the preceding year. Statistics of the catch were collected for both 1935 and 1936 in the Chesapeake, Pacific, and Lake States and in Alaska, and, when considering the combined catch of these sections alone, an increase of 22 percent in the volume and 19 percent in the value of the catch is indicated. While these increases are reflected in each of the four geographical sections and in many species, they are especially important in increased catches of pilchard in California, and salmon in Alaska. The value of the production of canned fishery products in all sections increased 26 percent as compared with 1935; byproducts increased 17 percent; frozen fish about 1 percent; and packaged fish 6 percent.

The total catch of fishery products in the United States and Alaska as based on the most recent surveys, amounted to 4,840,299,000 pounds, valued at \$92,823,000. About 129,000 fishermen were employed in making this catch.

In 1936 in the United States and Alaska, the production of canned fishery products amounted to 794,707,014 pounds, valued at \$94,564,254; the output of byproducts was valued at \$34,976,347; and production of frozen fishery products, excluding packaged products, amounted to 106,679,695 pounds, estimated to be valued at \$8,700,000. Based on the most recent surveys the production of cured fishery products amounted to 116,310,859 pounds, valued at \$15,615,682, and fresh and frozen packaged fish and shellfish, 202,395,954 pounds, valued at \$26,894,905. It is estimated that about 680,000,000 pounds of fresh fishery products (excluding fresh packaged fish and shellfish), valued at about \$55,000,000, were marketed during 1936. The total marketed value to domestic primary handlers of all fishery products in 1936 is estimated at \$236,000,000.

Fishery products imported for consumption were valued at \$41,872,560 and domestic exports were valued at \$13,214,166.

New England States.—No survey for the entire catch of fishery products in these States was made for 1936. In 1935 both the volume and value of the catch showed an increase as compared with 1933, when the first preceding survey of the complete catch was made. There were increases in both the volume and value of the combined

landings of fishery products by vessels at Boston and Gloucester, Mass., and Portland, Maine, and a large increase in the production of Maine sardines in 1936 as compared with 1935.

Middle Atlantic States.—No complete survey for the catch of fishery products in these States was made for 1936. In 1935 there was a large increase in both volume and value of the catch as compared with the catch in 1933, when the first previous survey was made. There was a large increase in the production of frozen fish and in the catch of shad in the Hudson River in 1936 as compared with 1935.

Chesapeake Bay States.—In 1936 the catch of fishery products in the Chesapeake Bay States increased in both volume and value as compared with the preceding year. The value of the menhaden products, which were produced in Virginia, increased appreciably; however, the production of fresh-shucked oysters and packaged fresh-cooked crab meat decreased.

South Atlantic and Gulf States.—The catch of fishery products in the South Atlantic and Gulf States during 1936 showed large increases in both volume and value over 1934, when the first preceding survey of the catch was made. There was a large increase in the volume and value of packaged fresh-cooked crab meat in 1936 as compared with 1934. The output of canned shrimp and oysters in 1936 showed only slight variation from the production in 1935.

Pacific Coast States.—The commercial catch of fishery products in these States for 1936 was the largest of any year on record and the value of the catch exceeded that of any previous year except 1929. The increased volume of the catch was largely accounted for by the record catch of pilchards in California. The 1936 production of canned sardines, tuna, and oysters increased as compared with 1935 while the packs of mackerel and salmon decreased.

Lake States.—In 1936 the commercial catch of fishery products in the Lake States increased in both volume and value as compared with 1935. The catch of blue pike was the largest on record, while that of yellow perch was below normal.

Mississippi River and tributaries.—The most recent complete statistics of the catch of the Mississippi River and tributaries are those collected for 1931. As compared with 1922, when the most recent preceding survey was made, there was a decrease in the catch. This decrease was reflected principally in a smaller catch of fresh-water mussels. A survey made for Lakes Pepin and Keokuk and the Mississippi River between these two lakes showed an increase in 1936 for the catch for Lake Keokuk and the river between the lakes, but a decrease in the figures for Lake Pepin. The production of fresh-water mussel-shell buttons increased in 1936 as compared with 1935.

Alaska.—The catch of fishery products in Alaska in 1936 increased in both volume and value as compared with 1935, and the pack of canned salmon was the largest in history. The production of fresh and frozen fishery products increased while that of byproducts and cured products decreased.

Fisheries of the United States and Alaska

SUMMARY OF CATCH: BY SECTIONS

[Expressed in thousands of pounds and thousands of dollars; that is, 000 omitted]

Product	New England, 1935 Area XXII		Middle Atlan- tic, 1935 Area XXIII		Chesapeake, 1936 Area XXIII		South Atlantic and Gulf, 1936 Areas XXIV and XXV		Pacific, 1936

¹ Included in vessels.

² Includes scows, houseboats, pile drivers, etc.

³ Statistics not available.

⁴ Includes packaged, cured, and canned fishery products, and byproducts.

⁵ Includes data for 1936 on packaged and canned products and byproducts.

NOTE.—Of the total number of persons engaged in the preparation of fishermen's manufactured products, 6,203 have also been included as fishermen, and 1,235 of the persons shown on transporting craft have also been included as fishermen.

MANUFACTURED FISHERY PRODUCTS

The output of manufactured fishery products (canned, cured, packaged, and byproducts) in the United States and Alaska during the most recent years for which data are available were valued at \$172,-051,188. Of this amount, canned products accounted for 55 percent, byproducts 20 percent, fresh and frozen packaged products 16 percent, and cured products 9 percent.

Since general statistical surveys were conducted in only the Chesapeake Bay, South Atlantic, Gulf, Lakes, and Pacific States, and Alaska for 1936, the following compilation of manufactured fishery products consists of composite data, based on the most recent statistics. The years covered by the data are indicated by footnotes.

¹ Data are for 1936 unless otherwise indicated.

² This is usually an intermediate product and although shown in the total may also be shown in its final stage of processing elsewhere in the table.

³ Data are for 1935.

⁴ This item represents a combination of 1936 and 1935 data.

⁵ This item represents a combination of 1936, 1935, and 1931 data.

⁶ This item represents a combination of 1936 and 1931 data.

⁷ Data are for 1931.

⁸ This item represents a combination of 1935 and 1931 data.

⁹ Includes fresh filets of amberjack, bluefish, catfish and bullheads, jewfish, kingfish or "king mackerel," king whiting or "kingfish," mullet, scup or porgy, sea robin, snook or sergeantfish, spot, suckers, tripletail, tullibees, and whiting.

¹⁰ Includes frozen filets of bluefish, halibut, lake herring, and squeteagues or "sea trout."

¹¹ Includes fresh steaks of cabio, cod, haddock, halibut, pollock, sea bass (Atlantic coast), and snook or sergeantfish.

¹² Includes frozen steaks of cod, pollock, and wolfish; packaged fresh-cooked spiny lobster meat; and fresh-shucked sea mussels.

¹³ Includes salted barracuda, bluefish, blue runner, chubs, cod strips and bits, haddock, salmon bellies, sea herring, black sea bass, pilchard, tenpounder, tuna, and yellowtail; tight-pack alewife roe; boneless cusk, mild-cured shad; pickled shrimp; and salted filets of hake, sea herring, and Spanish mackerel.

¹⁴ Includes smoked bluefish, cod, red drum, flounders, goldfish, goosfish, haddock, smelt, swordfish, tuna, filets of haddock and sea herring, sea herring roe, and spiced salmon.

¹⁵ Includes canned Alaska salted cod, pickled eels, finnan haddie, smoked salmon, kippered sturgeon, fresh-water crawfish, shrimp soup, hard clams steamed in the shell, hard clam stew, soft clam cakes, coquina clam broth, pickled sea mussels, frogs and frog legs, deep sea roe, rat poison bait, fish paste and bouillon, and crab and shrimp gumbo.

¹⁶ Includes sea herring and groundfish (white fish), dry scrap, and miscellaneous acid and dry scrap.

¹⁷ Includes burbot, tullibee, salmon-egg, abalone, soft clam, cod-liver, and miscellaneous fish meals.

¹⁸ Includes burbot-, halibut-, "lingcod-", sablefish-, swordfish-, totuava-, and cod-liver oils.

¹⁹ Includes rosefish and miscellaneous fish oils.

²⁰ Includes isinglass, kelp products, pearl essence, shark skins, and fresh-water mussel-shell novelties, stucco, and chips.

NOTE.—Some of the above products have been manufactured from products imported from another country; therefore, they cannot be correlated directly with the catch within the United States and Alaska.

CANNED FISHERY PRODUCTS AND BYPRODUCTS TRADE

The output of canned fishery products and byproducts in the United States and Alaska in 1936 was valued at \$129,533,238. Of this total, canned products comprised \$94,564,254, and byproducts, \$34,968,984—an increase of 26 percent in the value of canned products and 18 percent in the value of byproducts when compared with the respective values of the same groups of commodities for the previous year.

Fishery products were canned at 412 establishments in the United States and Alaska during 1936. The combined output of these canneries amounted to 20,097,976 standard cases. The net weight of the products canned amounted to 794,707,014 pounds.

Canned fishery products or byproducts were prepared in 25 States and in Alaska during 1936. Alaska ranked first in the value of the products, accounting for 36 percent of the total, and California ranked second, with 31 percent.

NOTE.—Mussel shells purchased by manufacturing plants during the year amounted to 58,484,000 pounds, valued at \$891,677. Shells were purchased from 18 States in the Mississippi River Valley and Great Lakes region. The producing States in order of their importance were Arkansas, which contributed 35 percent of the total quantity; Illinois, 14 percent; Tennessee and Indiana, each 12 percent; Kentucky, 7 percent; Iowa, 4 percent; Michigan and Wisconsin, each 3 percent; Ohio and Mississippi, each 2 percent; Texas and South Dakota, each 1 percent; and Alabama, Kansas, Oklahoma, Missouri, Minnesota, and Louisiana, each less than 1 percent.

³³ Includes the production of burbot-liver oil in Minnesota and Wisconsin.

³⁴ Includes groundfish, herring, and miscellaneous acid and dry scrap.

³⁵ Includes salmon-egg, abalone, clam and miscellaneous meals, and cod-liver pressings.

³⁶ Includes a considerable production of salmon oil especially prepared for human consumption.

³⁷ Includes burbot, halibut, "lingcod," sablefish, swordfish, totuava, and tuna-liver oils.

³⁸ Includes rosefish and miscellaneous fish oils.

³⁹ A quantity of liquid glue produced by one firm in California is included with the production of liquid glue of the Atlantic and Gulf coasts.

⁴⁰ Includes isinglass, shark skins, kelp products, and pearl essence.

FROZEN-FISH TRADE ³

FISH FROZEN

During 1936 the freezing plants which reported their activities to the Government froze 179,273,698 pounds of fishery products. These products at the time they were held in cold storage plants, were estimated to be valued at about \$15,000,000. Compared with the output in 1935 this was an increase of 20 percent in volume. Five species or groups of species accounted for 64 percent of the total amount frozen. In the order of their importance they were cod, haddock, hake, and pollock (including cod, haddock, and pollock fillets), which accounted for 27 percent of the total; whiting, 16 percent; halibut, 9 percent; salmon, 7 percent; and mackerel, 5 percent. Other products frozen in considerable quantities during the year were sea herring and shellfish.

Production of frozen fishery products, 1936

¹ New England includes the 6 States of that section: Middle Atlantic—New York, New Jersey, and Pennsylvania; South Atlantic—Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida; North Central, East—Ohio, Indiana, Illinois, Michigan, and Wisconsin; North Central, West—Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas; South Central—Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Texas, Oklahoma, and Arkansas; and Pacific—Washington, Oregon, California, and Alaska.

HOLDINGS

During 1936 monthly holdings of frozen fish and shellfish averaged 61,990,000 pounds, which is an increase of 19 percent as compared with the average monthly holdings in 1935. The largest supplies were in storage in December when 94,695,000 pounds were on hand and the smallest quantity was in storage in April when 26,102,000 pounds were held. The holdings during each of the months from September to December exceeded 84,000,000 pounds.

Holdings of frozen fishery products, 1936

² New England includes the 6 States of that section; Middle Atlantic—New York, New Jersey, and Pennsylvania; South Atlantic—Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida; North Central, East—Ohio, Indiana, Illinois, Michigan, and Wisconsin; North Central, West—Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas; South Central—Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Texas, Oklahoma, and Arkansas; and Pacific—Washington, Oregon, California, and Alaska.

³ Includes a small amount of fish held in Colorado in the Mountain section.

COLD-STORAGE HOLDINGS OF CURED FISH

During 1936 monthly cold-storage holdings of cured herring and mild-cured salmon averaged 21,499,000 pounds which is an increase of 67 percent as compared with the average monthly holdings in 1935. The holdings during October were the largest, amounting to 30,666,265 pounds, and the smallest were in February, amounting to 14,417,137 pounds.

FOREIGN FISHERY TRADE

The foreign trade in fishery products of the United States in 1936 amounted to \$55,086,726, of which \$41,872,560 represents the value of these products imported for consumption, and \$13,214,166, the value of exports of domestic fishery products. Compared with the previous year, there was an increase of 9 percent in total trade, and 16 percent in the value of the imports, but a decrease of 8 percent in the value of exports.

Imports consisted of 371,205,567 pounds of edible products, valued at \$30,356,439, and nonedible products, valued at \$11,516,121. Fishery exports consisted of 111,259,302 pounds of edible products, valued at \$12,262,784, and nonedible products, valued at \$951,382.

Import duties levied on fishery products imported during 1936 totaled \$6,544,971.

FISHERIES OF THE NEW ENGLAND STATES(Area XXII) ⁴

The most recent complete fishery statistics for the New England States (Maine, New Hampshire, Massachusetts, Rhode Island, and Connecticut) are those collected for the year 1935. In that year the yield of the commercial fisheries amounted to 655,430,400 pounds, valued at \$17,983,594 to the fishermen, representing an increase of 31 percent in volume, and 33 percent in value as compared with the catch in 1933, the most recent previous year for which statistics are available. Detailed statistics of these fisheries for 1935 appear in "Fishery Industries of the United States, 1936," appendix I to the Report of the United States Commissioner of Fisheries, 1937. A summary of these fisheries as well as statistics of the vessel fisheries at the principal New England ports for 1936 and the mackerel fishery of the Atlantic coast for 1936 appear in the following tables.

Fisheries of the New England States, 1935

⁴ This is the number given this area by the North American Council on Fishery Investigations. It should be explained that there are included under this area craft whose principal fishing ports are in the area but at times fish elsewhere. Notable examples are the groundfish fishery in area XXI and the mackerel and southern trawl fisheries in area XXIII. For a clearer understanding of the statistics published in this section, the reader is referred to the section in the latter part of this document entitled "Statistical survey procedure."

1 Excluding seed oyster fishery. The seed oyster fishery in this section was prosecuted in Rhode Island and Connecticut where 167 fishermen, using 28 vessels, 1 motorboat, 15 other boats, 161 dredges, and 7 tongs, took 106,243 bushels of seed oysters, valued at \$42,600, from public beds, and 376,568 bushels, valued at \$175,934 from private beds. Of the total number of persons fishing for seed oysters, 13 are duplicated among those fishing for market oysters or other species. Similarly the following craft and gear are duplicated: 2 vessels, 4 dredges, and 2 tongs.

Statistics on hard-shell mollusks (including periwinkles and limbs, scallops, and sea urchins) are reported by the States of Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Louisiana, Mississippi, Texas, and California. Statistics on soft-shell mollusks (including clams, oysters, and mussels) are reported by the States of Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Louisiana, Mississippi, Texas, and California. Statistics on shrimp are reported by the States of Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Louisiana, Mississippi, Texas, and California. Statistics on squid are reported by the States of Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Louisiana, Mississippi, Texas, and California. Statistics on sea urchins are reported by the States of Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Louisiana, Mississippi, Texas, and California. Statistics on sand are reported by the States of Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Louisiana, Mississippi, Texas, and California.

NOTE.—Totals for the States of Maryland, Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Louisiana, Mississippi, Texas, and California are based on the following data:

¹ Data are for 1936.

² This item is usually an intermediate product, and although included in the total, may also be shown in its final stage of processing in this or another State.

³ This item has been included under "Unclassified products."

⁴ Includes fresh fillets of flounder and frozen fillets of cusk, rosefish, wolffish, and hake.

⁵ Includes fresh fillets of halibut and whiting; frozen fillets of bluefish, halibut, and salmon; fresh steaks of cod, haddock, halibut, pollock, salmon, and swordfish; and frozen steaks of cod, halibut, pollock, salmon, swordfish, and wolffish.

⁶ Includes salted fillets of hake and sea herring; dry-salted cusk; and salted boneless hake and whole sea herring.

⁷ Includes dry-salted cod, pollock, and haddock; green-salted cod, cusk, pollock, and hake; salted boneless cusk and hake; whole and pickled sea herring, and strips and bits of cod.

⁸ Includes smoked fillets of cod, haddock, and sea herring; and finnan haddie.

⁹ Includes smoked alewives, butterfish, carp, cod filets, haddock (finnan haddie), lake trout, mackerel, salmon, sea herring (medium-scaled, and hard and soft bloaters), shad, and whitefish; and smoked and spiced salmon.

¹⁰ This item has been included under "Miscellaneous."

¹¹ This item has been included under "Other" canned products.

¹² Includes canned alewife roe, finnan haddie, mackerel, fish chowder, clam cakes, and cat and dog food.

¹³ Includes canned groundfish roe, mackerel, finnan haddie, fish chowder, fiskeboller, hard and soft clam chowder, and rat poison bait.

¹⁴ Includes halibut, swordfish, tuna, sablefish, "lingcod," and mixed liver oils.

¹⁵ Both 1935 and 1936 data are included in these items.

¹⁶ Includes fresh-cooked lobster meat; fresh-shucked sea mussels; herring dry scrap; soft clam, groundfish, miscellaneous fish and waste fish meals; cod-liver oil; marine-shell buttons and pearl essence.

¹⁷ Includes fresh-shucked oysters, cod and rosefish oil, cod liver pressings, groundfish dry scrap, glue, isinglass, and marine-shell buttons and novelties.

¹⁸ Includes fresh-cooked lobster meat, fresh-cooked packaged crab meat, finnan haddie, canned hard clam chowder, oyster-shell poultry feed and lime, and marine-shell novelties.

¹⁹ Includes smoked butterfish, carp, lake trout, mackerel, salmon, whitefish, and paddlefish or spoonbill cat; and marine-shell novelties.

NOTE.—Unless otherwise indicated the data are for 1935. The total value of manufactured products for the New England States was as follows: By manufacturing establishments, \$25,476,907; and by fishermen \$680,020. Some of the above products may have been manufactured from products imported from another State or a foreign country, therefore they cannot be correlated directly with the catch within the State. Of the total number of persons engaged in the preparation of fishermen's manufactured products, 3,664 have also been included as fishermen, and 8 of the persons shown on transporting craft have also been included as fishermen. This should be considered when computing the total number of persons in the fishery industries exclusive of duplication.

VESSEL FISHERIES AT PRINCIPAL NEW ENGLAND PORTS

Due to the importance of the ports of Boston and Gloucester, Mass., and Portland, Maine, as landing points for fishery products, detailed monthly statistics are collected for these landings which are published in the following sections.

ECONOMIC ASPECT

The landings of fishery products at the three principal New England ports (Boston and Gloucester, Mass., and Portland, Maine), by vessels of 5 net tons capacity or more, during 1936, amounted to 414,767,145 pounds as landed, valued at \$11,143,545. This is an increase of 11 percent in the quantity of the catch as compared with 1935, and an increase of 24 percent in the value of the catch. The landings at Boston accounted for 339,224,764 pounds, valued at \$9,588,115 or 82 percent of the total volume; the landings at Gloucester amounted to 59,413,534 pounds, valued at \$1,171,681, or 14 percent of the total; and the landings at Portland amounted to 16,128,847 pounds, valued at \$383,749, or 4 percent of the total.

Among the landings of fresh fish, haddock far outranked other species in volume landed. Landings of all sizes in 1936 amounted to 143,878,750 pounds, or 35 percent of the total fresh fish.

Landings by fishing vessels at the three principal New England ports, 1936

NOTE.—The weights of fresh and salted fish given in these statistics represent the fish as landed from the vessels, and the values are those received by the fishermen. Large cod are classified as those weighing over 10 pounds; market cod, 2½ to 10 pounds; and scrod cod, 1 to 2½ pounds. Large haddock are those weighing over 2½ pounds and scrod haddock, 1 to 2½ pounds. Large hake are those weighing over 6 pounds and small hake, under 6 pounds. Only landings by vessels having a capacity of 5 net tons or greater are used in this tabulation.

¹ The items under "Other, fresh" include alewives, 278,930 pounds, value \$2,574; bluefish, 500 pounds, value \$30; butterfish, 209,914 pounds, value \$15,129; cunner (perch), 1,250 pounds, value \$36; eels, 400 pounds, value \$15; herring smelt, 41,895 pounds, value \$1,293; salmon, 308 pounds, value \$45; scup, 44,200 pounds, value \$587; sea bass, 206 pounds, value \$21; shad, 66,444 pounds, value \$2,028; sharks, 58,424 pounds, value \$1,652; skates, 30,280 pounds, value \$609; squeteagues or "sea trout," 30 pounds, value \$3; sturgeon, 2,414 pounds, value \$217; tuna or "horse mackerel," 23,537 pounds, value \$1,168; whiting, 17,666,933 pounds, value \$297,435; mixed fish, 39,875 pounds, value \$696; lobsters, 3 pounds, value \$1; shrimp, 1,430 pounds, value \$119; squid, 5,655 pounds, value \$161; livers, 342,097 pounds, value \$14,321; sounds, 20 pounds, value \$1; spawn, 132,639 pounds, value \$7,005; and tongues, 202 pounds, value \$2.

BIOLOGICAL ASPECT

In 1936 the fishing fleet landing fares at Boston and Gloucester, Mass., and Portland, Maine, and operating on the fishing banks of the North Atlantic, numbered 392 steam, motor, and sail vessels of 5 net tons capacity or greater as measured by the United States Customs Service. These vessels were absent from port 55,309 days. The catch of edible fish landed at the three ports amounted to 416,384,118 pounds when the salted fish had been converted to the basis of fresh gutted or round fish as usually landed. This, however, does not represent the entire catch of edible fish of these vessels, for landings were also made at ports in New England other than these three, at New York City, and at more southern ports in connection with the southern winter trawl and mackerel fisheries.

Otter trawls on all sizes of vessels accounted for 309,551,194 pounds, or 74 percent of the total landings. Line trawls were next in importance, accounting for 49,714,305 pounds, or 12 percent of the total landings.

The catch taken off New England and landed at the three ports amounted to 264,212,798 pounds, or 64 percent of the total; that off Nova Scotia 146,939,445 pounds, or 35 percent; off the east coast of Newfoundland 4,086,552 pounds, or 1 percent; and that off the Middle Atlantic States 1,145,323 pounds, or less than one-half of 1 percent.

Landings by fishing vessels at the three principal New England ports, 1936

¹ Exclusive of duplication.² Incidental catch.

NOTE.—The three principal New England ports are Boston and Gloucester, Mass., and Portland, Maine. Otter trawls are classified according to the size of the vessel. The weight of salted fish landed has been converted to the equivalent of fresh fish as landed. Only landings by vessels having a capacity of 5 net tons or greater are used in this tabulation. "Occasional" after the name of a bank or ground indicates that the vessel or vessels contributing to the catch as shown fished chiefly with another type of gear. In such cases the number of vessels fishing, number of trips, and number of days absent, are shown under the principal type of gear used. A trip is shown for each area in which a vessel operated on each voyage. Consequently several trips may be shown for a single voyage.

MACKEREL FISHERY OF THE ATLANTIC COAST¹

In 1936, the mackerel fleet landed 40,221,600 pounds of mackerel, a decrease of 24 percent as compared with corresponding statistics of the preceding year.

An unusual feature of this year's activity was the fishery in the Block Island region, which extended from May 6 to November 25 and yielded more poundage than the Gulf of Maine.

Of the total landings, about 3,000,000 pounds were tinkers (fish under one pound) and 37,000,000 pounds were of larger sizes. The tinkers were caught between July 1 and October 31, with 91 percent of them being taken during August and September.

Mackerel fishery of the Atlantic coast, 1936

¹Numbers for certain terminals appearing in the box heads of the above table refer to the numbers given to the vessels by the North American Council on Fishery Investigations.

²Statistics were prepared by J. R. Webster under the direction of O. E. Sette of the Division of Scientific Fisheries, United States Fish and Wildlife Service, Cape May and Wildwood, N. J., New York, N. Y.; New Bedford, Mass.; Gloucester, Mass.; Boston, and Gloucester, Mass.; and Portland, Maine. It pertains to vessels "seiners," drift-gill-net vessels "netters," and such boats as fish for the open market and on the same grounds as the vessels. It does not include the catch of the smaller boats of the catch by other forms of gear.

NOTE.—The roman numerals appearing in the stub of the above table refer to the numbers given these areas by the North American Council on Fishery Investigations.

FISHERIES OF THE MIDDLE ATLANTIC STATES

(Area XXIII) ⁶

The most recent complete fishery statistics for the Middle Atlantic States (New York, New Jersey, Pennsylvania, and Delaware) are those collected for the year 1935. In that year the yield of the commercial fisheries amounted to 279,438,100 pounds, valued at \$6,415,664 to the fishermen, representing an increase of 65 percent in volume and 33 percent in value as compared with the catch in 1933, the most recent previous year for which catch statistics are available. Detailed statistics of these fisheries for 1935 appear in "Fishery Industries of the United States, 1936," appendix I to the Report of the United States Commissioner of Fisheries, 1937. A summary of these fisheries and statistics on the catch and operating units of the fisheries of Delaware for 1936 as well as the 1936 shad fishery of the Hudson River appear in the following tables. Data on the fisheries of Delaware for 1936 were made possible through the cooperation of the State of Delaware in furnishing personnel to aid in a survey of that State.

⁶ This is the number given to this area by the North American Council on Fishery Investigations. It should be explained that there are included in this area craft whose principal fishing ports are in the area but at times fish elsewhere. A notable example is the southern trawl fishery which extends into area XXIV. For a clearer understanding of the statistics published in this section, the reader is referred to the section in the latter part of this document entitled "Statistical survey procedure."

¹ Excluding the seed oyster fishery. The seed oyster fishery in New York, New Jersey, and Delaware was prosecuted by 1,379 fishermen who used 114 vessels, 73 motorboats, 145 other boats, 230 dredges, 202 tongs, and 25 rakes; and took 937,970 bushels of seed oysters, valued at \$309,456 from public beds, while 41,874 bushels, valued at \$28,540, were taken from private beds. Of the total number of persons fishing for seed oysters, 1,260 are duplicated among those fishing for market oysters or other species. Similarly, the following craft and gear are duplicated: 81 vessels, 33 motorboats, 19 other boats, 164 dredges, 34 tongs, and 8 rakes.

² Statistics on hard clams are based on yields of 8 pounds of meats to the bushel in New York, 9.76 pounds in New Jersey, and 10 pounds in Delaware.

³ Statistics on soft clams are based on yields of 16 pounds of meats to the bushel in New York, and 20 pounds in New Jersey.

¹ The production of this item is included under "Unclassified products."

² Data are for 1936.

³ This item has been included under "Miscellaneous."

⁴ Includes smoked butterfish, chubs, haddock filets, finnan haddie, sea herring (bloaters and kippers) lake trout, mackerel, salmon, shad, sturgeon, and whitefish; and kippered salmon and shad.

⁵ Includes canned pickled eels, fish paste, hard-clam products, pickled sea mussels, and terrapin, and turtle products.

⁶ Both 1935 and 1936 data are included in these items.

⁷ Includes fresh filets of bluefish and halibut; smoked eels; halibut- and tuna-liver oil; menhaden products; miscellaneous fish meal; and mussel-shell buttons.

⁸ Includes fresh filets of cod, flounders and haddock; smoked bluefish, cod, cod filets and steaks, eels, flounders, goosefish, haddock, lake trout, shad, and sea herring (bloaters); fresh-shucked soft clams; salted boneless cod; canned hard-clam products and oysters; swordfish, tuna and totuava liver oil; and menhaden products.

⁹ Includes fresh-shucked hard clams, marine-shell buttons; and miscellaneous fish scrap.

¹⁰ Includes oyster-shell products, king crab scrap, and menhaden products.

NOTE.—Unless otherwise indicated, data are for 1935. The total value of the manufactured products for the Middle Atlantic States was as follows: By manufacturing establishments, \$14,691,923; and by fishermen \$378,741. Some of the above products may have been manufactured from fishery products imported from another State or a foreign country; therefore, they cannot be correlated directly with the catch within the State. Of the total number of persons engaged on transporting craft, 125 have been included as fishermen, and among the total number of persons engaged in the preparation of fishermen's prepared products, 552 have been included as fishermen. The whale products shown above were manufactured on a floating factory ship operating in the Southern Hemisphere.

VESSEL FISHERIES AT NEW YORK CITY

During 1936 fishing vessels of 5 net tons capacity or greater landed 37,807,000 pounds of fishery products at New York City. The landings consisted of bluefish, 1,228,000 pounds; butterfish, 966,000 pounds; cod, 6,736,000 pounds; croaker, 5,000 pounds; conger eels,

5,000 pounds; flounders, 10,892,000 pounds; haddock, 9,758,000 pounds; hake, 73,000 pounds; halibut, 9,000 pounds; mackerel, 3,434,000 pounds; pollock, 65,000 pounds; sea bass, 594,000 pounds; scup or porgy, 1,066,000 pounds; swordfish, 1,000 pounds; tilefish, 2,563,000 pounds; whiting 288,000 pounds; wolffish, 3,000 pounds; sea scallops, 110,000 pounds; and squid, 11,000 pounds. Data on the landings at New York City are also included in the catch by States.

SHAD FISHERY OF THE HUDSON RIVER

The shad fishery of the Hudson River in 1936 was prosecuted by 476 fishermen who used 207 boats, 14 haul seines, 124 drift gill nets, 1,223 stake gill nets, and 16 fyke nets. The total commercial catch amounted to 697,225 shad having a weight of 2,467,900 pounds and a value to the fishermen of \$170,187. This is an increase of 168 percent in the number of shad and 141 percent in their value as compared with 1935. The average price per pound received by the fishermen was about 7 cents compared with a price of about 8 cents in 1935.

Gill nets accounted for 99 percent of the weight of the shad taken, while haul seines accounted for less than 1 percent. Fyke nets accounted for the remainder of the catch.

Statistics of the catch of shad in the Hudson River also are included in the catch data for New York and New Jersey which are published elsewhere in this report.

FISHERIES OF THE CHESAPEAKE BAY STATES

(Area XXIII)⁷

The yield of the commercial fisheries of the Chesapeake Bay States (Maryland and Virginia) during 1936 amounted to 314,094,800 pounds valued at \$6,487,641 to the fishermen. This is an increase of 18 percent in volume and 17 percent in value as compared with the catch in the previous year. These fisheries gave employment to 18,283 fishermen or 4 percent less than during 1935.

There were 585 wholesale and manufacturing establishments in the two States in 1936, the same number as in the previous year. In 1936 these establishments gave employment to 12,663 persons, paid \$3,073,443 in salaries and wages, and produced manufactured products (canned, cured, packaged, and byproducts), valued at \$9,813,684. In 1935 the wholesale and manufacturing firms employed 13,213 persons, paid \$3,055,029 in salaries and wages, and produced manufactured products valued at \$9,411,465.

⁷ This is the number given to this area by the North American Council on Fishery Investigations. It should be explained that there may be included under this area, craft whose principal fishing ports are in the area but at times fish elsewhere. Data on the operating units and catch of the fisheries of the Chesapeake Bay States have been taken largely from statistics collected by the State fishery agencies of Maryland and Virginia. Supplementary surveys, compilations, and analyses have been made by agents of this Bureau in order that the figures may be presented in a manner comparable with those of other sections. It should be observed that the persons engaged, gear and craft employed, and catch of the seed oyster fishery are not included among the statistics of the fishery for market oysters and other species but are shown in separate tables in this section. For a clearer understanding of the statistics published in this section, the reader is referred to the section in the latter part of this document entitled "Statistical survey procedure."

¹ Statistics on hard clams used in this table are based on yields of 8 pounds of meats per bushel in Maryland, and 8.02 pounds in Virginia.

² Statistics on market oysters used in this table are based on yields of 6.15 pounds of meats per bushel in Maryland, and 5.42 pounds in Virginia.

NOTE.—The seed oyster fishery was prosecuted in this section only in Virginia where 1,397 fishermen using 16 motor vessels, 488 motor boats, 267 other boats, 1,029 tongs, and 188 rakes took 830,094 bushels of seed oysters valued at \$200,724 from public beds and 15,040 bushels valued at \$3,008, from private beds. Of the total number of persons fishing for seed oysters, 1,343 are duplicated among those fishing for market oysters or other species. Similarly, the following craft and gear are duplicated: 10 vessels, 480 motor boats, 248 other boats, 981 tongs, and 188 rakes.

¹ The production of this item is included under "Unclassified products."

² This item is usually an intermediate product and, although included in the total, may be shown in its final stage of processing in this or another State.

³ Includes fresh fillets of haddock, sea robin, scup, and Spanish mackerel.

⁴ Includes salted spot and corned and tight-pack cut alewives; smoked alewives, butterfish, carp, chub, cisco, tullibees, eels, sea herring, salmon, sturgeon, lake trout, and whitefish.

⁵ The production of this item is included under "Miscellaneous."

⁶ Includes canned fish paste, oysters, and oyster, shrimp, and terrapin soup.

⁷ Includes alewife and blue crab scrap.

⁸ Includes miscellaneous fish scrap.

⁹ Includes alewife oil, marine-shell products, and pearl essence.

¹⁰ Includes fresh-shucked hard clams, tight-pack alewife roe, menhaden meal, miscellaneous acid scrap, miscellaneous oil, and canned blue crabs.

NOTE.—The total value of manufactured products in the Chesapeake Bay States was as follows: By manufacturing establishments, \$9,813,684; and by fishermen, \$8,325. Some of the above products may have been imported from another State or a foreign country; therefore, they cannot be correlated directly with the catch within the State. Of the total number of persons engaged on transporting vessels 685 have been included as fishermen, and among the total number of persons engaged in the preparation of fishermen's prepared products, all have been included as fishermen.

NOTE.—Of the total number of persons fishing for seed oysters, 1,343 are duplicated among those fishing for market oysters or other species. Similarly, the following craft and gear are duplicated: 10 vessels, 480 motor boats, 248 other boats, 981 tongs, and 188 rakes.

SHAD AND ALEWIFE FISHERIES OF THE POTOMAC RIVER

The catch of shad in the Potomac River in 1936 amounted to 134,409 in number, 359,800 pounds in weight and their total value to the fishermen was \$35,358. The catch of alewives for the same season amounted to 11,287,000 in number, with a total weight of 4,514,800 pounds, and a value to the fishermen of \$36,674. These figures show a decrease of 43 percent in the weight and 37 percent in the value of shad as compared with 1935, and an increase of 1 percent in weight and 38 percent in the value of alewives.

Approximately 68 percent of the shad, in weight, were taken with pound nets, and 30 percent with gill nets. About 99 percent of

the alewives were taken with pound nets, the remainder being taken with gill nets and fyke nets.

Statistics of the catch of shad and alewives in the Potomac River are also included in the catch data for Maryland and Virginia which are published elsewhere in this report.

TRADE IN FISHERY PRODUCTS IN WASHINGTON, D. C.

The municipal fish wharf and market in Washington, D. C., is located in the southwestern part of the city on an arm of the Potomac River. At the present time 18 firms have stalls in this market, 2 are located in the immediate vicinity of the market, 3 have stalls in the Center Market, located at Fifth and K Streets NW., and 2 are located in other parts of the city. Altogether there are 25 firms which employ 131 persons who received \$145,621 in salaries and wages during 1936. Of the total employees 90 were regularly employed. These firms conduct mainly a wholesale business although some retail trade is carried on.

The facilities for handling fish and oysters from boats and vessels that may land at the wharf are good, but only a comparatively small quantity are brought into the city by this method. In the fall and winter, considerable quantities of shell oysters are landed, but most of the oysters handled in Washington are brought in already shucked from Maryland and Virginia, by trucks and other transportation facilities.

During the year 1936 the receipts of fresh and frozen fishery products as received at the municipal fish wharf amounted to 9,395,945 pounds. This is a decrease of 23 percent as compared with 1935, and a decrease of 10 percent as compared with the 5-year average.

During 1936 two firms in Washington, D. C., smoked fishery products and one firm produced shucked oysters. The total value of the products produced by these firms amounted to \$22,424.

Fishery products received at municipal fish wharf and market, Washington, D. C., 1936¹

FISHERIES OF THE SOUTH ATLANTIC AND GULF STATES

(South Atlantic, Area XXIV; Gulf, Area XXV)⁸

The yield of the commercial fisheries of the marine areas of the South Atlantic and Gulf States (North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas) during 1936 amounted to 556,992,700 pounds, valued at \$13,542,301 to the fishermen, representing an increase of 24 percent in volume and 36 percent in value as compared with the catch in 1934, the most recent year for which catch statistics are available. These fisheries gave employment to 29,006 fishermen as compared with 24,898 in 1934.

There were 703 fishery wholesale and manufacturing establishments in these States in 1936, as compared with 591 in 1934, when the most recent previous survey of these establishments was made. In 1936 these establishments employed 17,095 persons, paid \$3,296,241 in salaries and wages and produced manufactured products (canned, cured, packaged, and byproducts), valued at \$11,445,674. In 1934, the wholesale and manufacturing firms employed 14,354 persons, paid \$2,873,812 in salaries and wages and produced manufactured products valued at \$9,906,595.

Fisheries of the South Atlantic and Gulf States, 1936

¹ Statistics on hard crabs used in this table are based on yields of 6 pounds per dozen in North Carolina, South Carolina, and Georgia; 5.96 pounds in Florida; 5.81 pounds in Alabama; 5.50 pounds in Mississippi; 5.59 pounds in Louisiana; and 5.21 pounds in Texas.

² Statistics on hard clams used in this table are based on yields of 8 pounds of meats per bushel in all States.

³ Statistics on market oysters used in this table are based on yields of 4.96 pounds of meats per bushel in North Carolina; 4.64, in South Carolina; 6.01, in Georgia; 4.18, in Florida; 4.11, in Alabama; 3.59, in Mississippi; 3.77, in Louisiana; and 4.92, in Texas.

NOTE.—The catch for Mississippi includes the following products taken by Mississippi craft in Louisiana waters: Shrimp, 15,748,300 pounds, valued at \$423,899; oysters, market, spring, 4,009,200 pounds of meats, valued at \$244,879; oysters, market, fall, 56,700 pounds, valued at \$3,884. The seed oyster fishery was prosecuted in this section only in North Carolina where 55 regular and 45 casual fishermen using 37 motor boats and 37 dredges took 55,500 bushels of seed oysters, valued at \$11,100, from public beds. Of these regular fishermen 38 are duplicated among those fishing for market oysters or other species. Similarly 14 motor boats are duplicated.

¹ This item has been included under "Unclassified products."

² This item has been included under "Miscellaneous."

³ Includes fresh fillets of amberjack, black and red drum, jewfish, king mackerel, mullet, mangrove and red snapper, snook, Spanish mackerel, gray squeteague, and tripletail; and fresh steaks of cabio, red snapper, and snook.

⁴ Includes salted bluefish, blue runner, tenpounder, and Spanish mackerel fillets.

⁵ Includes canned hard-clam products, coquina clam broth, oysters, turtle products, and frog products.

⁶ Includes fresh fillets of bluefish, croaker, red drum, flounders, king whiting, sea bass, Spanish mackerel, spot, and gray squeteague; smoked red drum and mullet; cooked and peeled shrimp; fresh-shucked hard clams; and oyster-shell lime.

⁷ Includes packaged fresh-cooked crab meat, and oyster-shell poultry feed and lime.

⁸ Includes pickled shrimp; canned oysters and terrapin products; and menhaden acid scrap and oil.

⁹ Includes menhaden meal; shark skins, fins and oil; packaged fresh-cooked sea crawfish meat; oyster-shell poultry feed and lime; and marine-shell novelties.

¹⁰ Includes fresh fillets of Spanish mackerel; fresh steaks of sea bass, and red snapper; frozen fillets of gray squeteague; salted mullet; canned shrimp; and oyster-shell poultry feed and lime.

¹¹ Includes salted mullet, canned crab and shrimp gumbo, and canned shrimp soup.

¹² Includes canned fish bouillon, fresh-water crawfish, terrapin meat, turtle soup, and frog products; and oyster-shell poultry feed and lime.

¹³ Includes packaged fresh-cooked crab meat and oyster-shell poultry feed and lime.

NOTE.—The total value of manufactured products in the South Atlantic and Gulf States was as follows: By manufacturing establishments, \$11,445,674; and by fishermen, \$143,784. Some of the above products may have been manufactured from products imported from another State or a foreign country; therefore, they cannot be correlated directly with the catch within the State. Of the total number of persons engaged in preparation of fishermen's manufactured products, 1,132 have also been included as fishermen and 415 of the persons shown on transporting craft have also been included as fishermen. This should be considered when computing the total number of persons in the fishery industries exclusive of duplication.

SPONGES SOLD AT THE EXCHANGE, TARPON SPRINGS, FLA.

During 1936 sponges sold on the exchange at Tarpon Springs, Fla., amounted to 418,839 pounds, valued at \$1,035,429. This is an increase of 8 percent in quantity and 67 percent in value as compared with the transactions during 1935. Of the total sponges sold on the exchange during 1936, 92,816 pounds, valued at \$371,994, were large wool; 26,572 pounds, valued at \$67,156, were medium and small wool; 197,152 pounds, valued at \$498,604, were wool rags; 76,470 pounds, valued at \$73,839, were yellow; 17,423 pounds, valued at \$17,254, were grass; and 8,406 pounds, valued at \$6,582, were wire. It is estimated that sponges valued at \$4,000 were sold outside of the exchange.

FISHERIES OF THE PACIFIC COAST STATES ⁹

The yield of the commercial fisheries of the Pacific Coast States (Washington, Oregon, and California) during 1936 amounted to 1,925,342,300 pounds, valued at \$24,881,509 to the fishermen, representing an increase of 15 percent in volume and 8 percent in value as compared with the catch in the previous year. These fisheries gave employment to 20,620 fishermen as compared with 20,583 in 1935.

⁹ Data on the operating units and catch of the fisheries of the Pacific Coast States have been taken largely from statistics collected by the various State agencies. Supplementary surveys, compilations, and analyses have been made by agents of this Bureau in order that the figures may be presented in a manner comparable with those of other sections. While statistics of the fisheries of California are for the calendar year, those for Oregon and Washington are for the fiscal year ending March 31, 1937, except that statistics of the halibut fishery in these latter States are for the calendar year. For a clearer understanding of the statistics published in this section the reader is referred to the section in the latter part of this document entitled "Statistical survey procedure."

There were 339 fishery wholesale and manufacturing establishments in the three States in 1936 as compared with 337 in 1935. During 1936 these establishments employed 16,589 persons, paid \$9,365,375 in salaries and wages, and produced manufactured products (canned, cured, packaged, and byproducts) valued at \$52,498,170. In 1935 the wholesale and manufacturing firms employed 14,750 persons, paid \$6,531,351 in salaries and wages, and produced manufactured products valued at \$51,243,348.

¹ The production of this item has been included under "Unclassified products."

² This item is usually an intermediate product, and although included in the total, may be shown in its final stage of processing in this or another State.

³ Includes fresh fillets of cod, "lingcod," and rockfishes; frozen steaks of cod and salmon; and fresh-shucked oysters and bay scallops.

⁴ This item has been included with "Miscellaneous."

⁵ Includes green salted cod in process, partly boned; spiced and pickled herring; salmon bellies; and sturgeon eggs for caviar.

⁶ Includes salted sablefish, and salmon, and sturgeon eggs for caviar.

⁷ Includes salted barracuda, black sea bass, cabrilla, pilchards, tuna, and yellowtail; pickled and spiced herring; boneless and absolutely boneless salted cod; green salted cod in process, partly boned; and mild-cured shad.

⁸ Includes smoked salmon, shad, smelt, and kippered sturgeon.

⁹ Includes smoked chub, mackerel, sablefish, swordfish, and tuna.

¹⁰ Includes canned salted cod, shad roe, hard clam chowder, and hard clams steamed in the shell.

¹¹ Includes canned smoked salmon, salmon eggs for bait, kippered sturgeon, whole razor clams, and razor clam juice.

¹² Includes pilchard, salmon, and salmon-egg meal.

¹³ Includes abalone and miscellaneous fish meal.

¹⁴ Includes pilchard and salmon oils, and miscellaneous liver oils.

¹⁵ Includes whale, sperm, and miscellaneous fish and liver oils.

¹⁶ Includes smoked herring bloaters and kelp products.

¹⁷ Includes fresh fillets of flounders, "lingcod," and rockfishes; fresh-shucked hard clams; salmon and salmon-egg meal; salmon oil; crushed oyster shells for poultry feed and lime; and marine-shell novelties.

¹⁸ Includes fresh-shucked eastern, Japanese, and native oysters, canned shad roe, dried shrimp, liquid glue, kelp products, oyster-shell lime, and marine-shell novelties.

NOTE.—The total value of manufactured products in the Pacific Coast States was as follows: By manufacturing establishments, \$52,498,170; and by fishermen, \$232,009. Some of the above products may have been imported from another State or foreign country; therefore, they cannot be correlated directly with the catch within the State. All of the persons engaged in the preparation of fishermen's manufactured products have been included as fishermen.

¹ Nearly all of the cod were taken off Alaska.

² The Washington coast pilchard fishery was inaugurated in 1936 as the result of legislation revising the State tax to permit the use of this fish for reduction purposes.

¹ Fished only on Indian reservations.

² In addition, the vessels of the Pacific coast halibut fleet landed approximately 655,000 pounds of halibut, sablefish, and "lingcod" livers at Seattle, valued at \$295,000.

³ These cod were taken off Alaska.

⁴ Statistics on the catch of salmon except those taken by troll lines, are reported to the State in number rather than pounds. The factors used in the above table for converting number of salmon to weight in pounds were as follows: Blueback, red, or sockeye, 7 pounds; chinook or king, 22 pounds; chum or keta, 11 pounds; humpback or pink, 5 pounds; and silver or coho, 8 pounds.

⁵ The weight of crabs shown is based on an average of 20 pounds per dozen.

⁶ Statistics on hard clams are based on yields of 28 percent edible meats for butter clams and 24 percent for little neck clams.

⁷ Statistics on oysters shown are based on yields of 18 percent edible meats for native oysters and 10 percent for Japanese oysters.

⁸ The weight of bay scallops is based on a yield of 17 percent edible meat.

Fisheries of the coastal district of Washington, 1936

¹ In addition a combined fleet of 16 Puget Sound and California purse seine vessels operated in the Washington coast pilchard fishery. These vessels were manned by a total of 163 fishermen and had an aggregate capacity of 654 net tons. Of the total vessels 15 were from Puget Sound and 1 from California. For detailed statistics regarding the operating units in this fishery refer to the gear tables in the Puget Sound and California sections of this report.

¹ The salmon were caught by Indians fishing on their reservations.

² Fished by Indians on their reservations.

³ Statistics on the the catch of salmon except those taken by troll lines are reported to the State in number rather than pounds. The factors used in the above table for converting number of salmon to weight in pounds were as follows: Blueback, red, or sockeye, 4.75 pounds; chinook or king, 20 pounds; chum or keta, 11 pounds; silver or coho, 10 pounds; and steelhead trout, 10 pounds.

⁴ Steelhead trout shown in this table were taken on Indian reservations.

⁵ The weight of crabs shown is based on an average of 22 pounds per dozen.

⁶ The weight of razor clams shown is in pounds of edible meats, based on a yield of 42 percent of the round weight.

⁷ The statistics on oysters used in this table are based on a yield of 14 percent of edible meats for Japanese and native oysters, and 13 percent for eastern oysters.

¹ In addition a combined fleet of 59 Oregon, Washington, and California purse seine vessels operated in the Oregon coast pilchard fishery. These vessels were manned by a total of 612 fishermen and had an aggregate capacity of 3,226 net tons. Of the total vessels, 1 was from the Columbia River district of Oregon, 23 from Washington, and 35 were from California. For detailed statistics regarding the operating units in this fishery refer to the gear tables in the Oregon Columbia River, Washington and California sections of this report.

HALIBUT FISHERY OF THE PACIFIC COAST¹⁰

The halibut fishery of the Pacific coast, which is prosecuted by United States (including Alaska) and Canadian vessels, ranks as one of the foremost fisheries of that section. During 1936 the total catch of halibut by vessels of both nationalities amounted to 48,054,000 pounds, valued at \$3,603,000. This is an increase of 5 percent in volume and 11 percent in value as compared with the catch and its value in 1935. Of the total catch in 1936, 78 percent was taken by United States craft and 22 percent by Canadian craft. Considered according to ports of landing, 47 percent was landed at Seattle, Wash.; 35 percent at Canadian ports; and 18 percent at ports in Alaska.

¹⁰ These statistics are compiled from data collected by the International Fisheries Commission for Washington and British Columbia, and by Bureau agents for Alaska. The weights of the above species represent the fish after evisceration and removal of heads.

Halibut fishery of the Pacific coast, 1936

¹ Less than \$500.

NOTE.—In addition to the above it is estimated that about 1,212,000 pounds of halibut, sablefish, “lingcod,” and rockfish livers, valued at approximately \$545,000 were landed by the combined fleets at Pacific coast ports during 1936.

The tabulation does not include landings at ports south of Seattle, Wash., which are normally less than 4 percent of the annual Pacific coast catch.

VESSEL FISHERIES AT SEATTLE, WASH.

A total of 49,831,417 pounds of fishery products, valued at \$3,254,-514, were handled by Seattle wholesale dealers during 1936, exclusive of quantities received by transporting vessels or by rail from Alaska or Canada. This represents an increase of 3 percent in volume and 8 percent in value as compared with the volume and value of the products handled during the preceding year. Of the total quantity 27,059,529 pounds, valued at \$2,201,774, were landed by fishing vessels—an increase of 8 percent in volume and 18 percent in value as compared with the previous year. Receipts by wholesale dealers from sources other than Alaska or Canada or from vessels in the halibut fleet, amounted to 22,771,888 pounds, valued at \$1,052,740, which is a decrease of 2 percent in volume and 8 percent in value.

Fishery products landed by United States vessels at Seattle, Wash., 1936 ¹

¹ This tabulation does not include fish received from Alaska or Canada, or vessels in the halibut fleet.² 47,659 dozen.

LAKE FISHERIES ¹¹

In 1936 the yield of the fisheries of the Great Lakes, including those of the international lakes of northern Minnesota, in the United States and Canada amounted to 124,408,100 pounds, representing an increase of 2 percent as compared with the catch in the preceding year.

Considering the fishery of United States craft only, the catch amounted to 94,276,500 pounds, valued at \$6,389,443, which is an increase of 4 percent in volume and 7 percent in value as compared with the catch in the previous year. These fisheries gave employment to 5,623 fishermen or 26 percent less than in 1934, the most recent previous year for which statistics on employment are available. During the survey for 1936 data, statistics of the catch in 1935 also were collected. These are presented following the data for 1936.

¹ Where there has been a Canadian catch of these species it is included under "Miscellaneous."

¹¹ The statistics of the catch presented herewith were obtained principally from records of the various State fishery agencies. The data for the operating units (fishermen, vessels, boats, and gear) of the United States were obtained largely by Bureau agents in a special canvass; although State records in several instances were very helpful in this work. In all cases the statistics collected are for the calendar year, except for Lake of the Woods, Rainy Lake, and Lake Namakan in Minnesota, which are for two seasons. For Lake of the Woods, the seasons are from June 1 to November 1 and December 1 to April 1 and for Rainy and Namakan Lakes from May 15 to November 1 and December 1 to April 1. The catches for these two seasons, in the order named, have been combined to constitute a year. The quantity of fish taken in these lakes between January 1 and April 1 is estimated at less than 3 percent of the total catch.

¹ This item has been included under "Unclassified products."

² A small amount of smoked chubs, lake trout, and whitefish produced in Indiana is included with the production for Illinois.

³ Includes fresh fillets of haddock, halibut, and lake trout; and frozen fillets of pike.

⁴ Includes fresh fillets of white bass and whitefish; and frozen fillets of pike and yellow perch.

⁵ The production of this item has been included under "Miscellaneous."

⁶ Includes fresh fillets of catfish and bullheads, lake herring, mackerel, salmon, suckers, tullibees, and white bass.

⁷ Includes smoked chubs, eels, goldeye, lake herring, salmon, sturgeon, tullibees, and whitefish.

⁸ Includes smoked buffalo fish, carp, goldeye, lake herring, shad, and whitefish.

⁹ Includes smoked carp, sablefish, salmon, and tullibees.

¹⁰ Includes smoked cisco, lake herring, sea herring, lake trout, salmon, tullibees, and whitefish, and kippered salmon.

¹¹ Includes fresh fillets of lake herring and whitefish; and smoked lake trout, sablefish, sturgeon, tullibees, and whitefish.

¹² Includes fresh fillets of lake herring and yellow perch; frozen fillets of lake herring; smoked butterfish, carp, mackerel, sablefish, and tullibees; and kippered salmon.

¹³ Includes fresh fillets of lake trout, salted chubs, canned whitefish caviar, burbot liver oil, and fresh-water mussel-shell poultry feed and lime.

¹⁴ Includes salted lake herring, burbot-liver oil, and burbot and tullibee meal.

NOTE.—The total value of the manufactured products for the Lake States was as follows: By manufacturing establishments, \$2,660,163; and by fishermen, \$51,438. Some of the above products may have been manufactured from products imported from another State or a foreign country; therefore, they cannot be correlated directly with the catch within the State. All of the persons engaged in the preparation of fishermen's manufactured products have also been included as fishermen and 2 of the persons shown on transporting craft have also been included as fishermen. This should be considered when computing the total number of persons in the fishery industries exclusive of duplication.

Lake fisheries of the United States and Canada, 1935

 FISHERIES OF THE MISSISSIPPI RIVER AND TRIBUTARIES ¹²

The most recent complete catch statistics of the fisheries for the States of the Mississippi River and tributaries are those collected for the year 1931. The yield of fishery products in that year amounted to 82,382,523 pounds, valued at \$2,897,357, which was a decrease of 22 percent in quantity and 36 percent in value as compared with the quantity and value of the catch in 1922 when the most recent preceding survey was made. Detailed statistics of the fisheries of the Mississippi River and tributaries for 1931 appear in "Fishery Industries of the United States, 1932" by R. H. Fiedler, appendix III to the Report of the Commissioner of Fisheries for the fiscal year 1933. A summary of these fisheries in 1931, as well as certain data for 1936, appear in the following tables.

¹² For a clearer understanding of the statistics published in this section, the reader is referred to the section in the latter part of the document entitled "Statistical survey procedure."

¹ Data are for 1936.² Data are for 1931 and 1936. Includes smoked buffalo fish and tullibees, and mussel-shell chips and novelties.³ The production of this item is included under unclassified products.⁴ Includes smoked eels, salmon, and sturgeon.⁵ Includes smoked buffalo fish, butterfish, carp, lake trout, paddlefish, sablefish, salmon, tullibees, and whitefish.

NOTE.—Unless otherwise indicated the data are for 1931. The total value of the manufactured products for the States of the Mississippi River and tributaries was as follows: By manufacturing establishments, \$4,002,120; and by fishermen, \$8,751. Some of the products may have been manufactured from fishery products imported from another State or a foreign country; therefore, they cannot be correlated directly with the catch within the State.

FISHERIES OF ALASKA ¹³

The commercial catch of fishery products in Alaska during 1936, exclusive of whales, amounted to 923,528,817 pounds, valued at \$13,891,412, which is an increase of 45 percent in quantity and 60 percent in value as compared with the catch in 1935. Of the total catch in 1936, 726,853,292 pounds, valued at \$11,856,541, consisted of salmon; 194,125,352 pounds, valued at \$1,882,603, other fish; and 2,550,173 pounds, value at \$152,268, shellfish. In addition, 385 whales were taken. These fisheries gave employment to 11,722 fishermen, 2,064 persons on transporting craft, and 16,597 persons in fishery wholesale and manufacturing industries—a total of 30,383 persons, which is an increase of 34 percent as compared with the number employed in 1935.

¹³ Statistics for the fisheries of Alaska are collected and compiled by the Alaska Division of this Bureau. A summary of these statistics appears in this section. For detailed figures the reader is referred to "Alaska Fishery and Fur-Seal Industries in 1936," by Ward T. Bower, appendix II to the Report of Commissioner of Fisheries for the fiscal year 1937.

Cod.....			722,011	4,420			722,011	4,420

Heretofore it was estimated that the shrinkage between the round weight of halibut and the eviscerated, heads-off weight, on which fishermen were paid, was 10 percent, but upon investigation it has been ascertained that the average shrinkage is 39 percent. The latter rate has been used, therefore, in determining the round weight of the halibut taken during 1936.

NOTE.—The output of fresh and frozen halibut includes all fares of the Alaska fleet, some of which were landed at other than Alaska ports. The amount of livers landed by the Alaska fleet was not reported, and the quantity shown here in is the estimated amount landed in Alaska. The total landings of halibut in Alaska in 1936, other than livers, amounted to 8,658,774 pounds, valued at \$507,484 (including 4,000 pounds, valued at \$240, landed by Canadian vessels).

STATISTICAL SURVEY PROCEDURE

In order that those who use the statistical data contained in this and previous reports of the Division of Fishery Industries may be informed as to the source of the figures and methods for their collection, it has been deemed advisable to outline, in considerable detail, the statistical survey procedure followed by the Division. This procedure has been developed over a period of years, and changes in method have been made at times where such changes have appeared to work toward general improvement. While the surveys in the several sections are not made in the same manner, owing to varying facilities and records in different States, an attempt has been made to make the data collected by various methods in the producing areas comparable with respect to the same year as well as over a period of years. Throughout the entire plan it has been the intention to coordinate State and Federal fishery statistical work so that there will be as little duplication of effort as possible. The procedure will be discussed under two main heads—"Sectional surveys" and "Local and special surveys."

SECTIONAL SURVEYS

Statistical surveys of the fisheries and fishery industries of the various sections of the United States occupy by far the greatest part of the time of the statistical personnel of the Division. It is in the course of these surveys that the statistical and marketing agents visit the individual fishing localities of the various States to collect statistics of the volume of the catch of fish and its value, employment in fishing, quantity of fishing gear, number and classification of fishing and transporting craft, employment in wholesale and manufacturing establishments, and the volume and value of manufactured fishery products and byproducts. The various phases of these surveys are discussed in detail in the sections following.

History.—The first comprehensive statistical survey of the fisheries and fishery industries of the United States was made for the year 1880 by George Brown Goode, Assistant Director of the U. S. National Museum, and associates, with the cooperation of the Commissioner of Fisheries and the Superintendent of the Tenth Census. Data for specific fisheries, or restricted sections for years prior to 1880, were also collected in this early survey and recorded in Mr. Goode's reports. The survey for 1880, however, did not include the Mississippi River and tributaries. Periodic general surveys of a limited number of States or limited areas of the United States were made for various of the intervening years between 1880 and 1908 and from 1909 to 1928. In 1908 a survey of the entire United States was made. The next general survey of the entire United States was not made until 1931, although complete data for all sections, excluding the Mississippi River and tributaries, were collected for 1929 and 1930. Complete data on the catch and operating units for all sections, excluding the Mississippi River and its tributaries, were collected for 1932. In the latter survey, however, lack of sufficient funds prohibited collection of data on wholesale and manufacturing firms except those data collected as a part of the canned fishery products and byproducts surveys. Complete general canvasses were made of the Chesapeake and Pacific States for the years from 1933 to 1936, inclu-

sive, the New England and Middle Atlantic States for 1933 and 1935, and the South Atlantic, Gulf, and Lake States for 1934 and 1936. Complete data on the catch of the fisheries of the Lake States were also collected for 1933 and 1935.

Following is a summary indicating the years for which statistics were collected on the fisheries and fishery industries in the various sections. Figures for the more recent years are available for free distribution from the Bureau in bulletin form, but figures for the earlier years are available only in the various printed reports of the Bureau. These reports are available for reference in the Bureau's library and at many public libraries.

In the New England States statistics on the catch of the marine fisheries, and those conducted in the coastal rivers and bays of these States, were collected for the years 1880, 1887, 1888, 1889, 1898, 1902, 1905, 1908, 1919, 1924, 1928, 1929, 1930, 1931, 1932, 1933, and 1935. For most of these years data on operating units and wholesale and manufacturing trade also were collected. In addition to the above, a partial statistical survey was made for the entire section in 1892; a partial survey of the fisheries in Maine, New Hampshire, and Massachusetts for the fiscal year 1897; the lobster fishery for 1900 and 1913; the oyster fishery for 1910; the shad and alewife fisheries for 1896; the menhaden industry for 1912; the fisheries of Massachusetts for 1879; and the fisheries of Connecticut for 1925 and 1926.

Statistics on the catch of the marine fisheries and those conducted in the coastal rivers and bays of the Middle Atlantic States were collected for the years 1880, 1887, 1888, 1889, 1890, 1891, 1897, 1898, 1901, 1904, 1908, 1921, 1926, 1929, 1930, 1931, 1932, 1933, and 1935. Data on operating units and wholesale and manufacturing trade also were collected for most of these years. In addition to these a statistical survey was made of the coastal fisheries of these States in 1915; catch in all States except New York, in 1892; the shad and alewife fisheries in 1896; the shad fisheries of the Delaware River in 1910; the shad fisheries of the Chesapeake Bay and tributaries in 1909; the menhaden industry in 1912; the lobster fisheries in 1900 and 1913; and the oyster fishery in 1911. The years for which statistics are available on the shad fishery of the Hudson River are given in the section entitled "Shad and alewife fisheries."

In the Chesapeake Bay States statistics on the catch of the marine fisheries and those conducted in coastal rivers and bays of these States were collected for the years 1880, 1887, 1888, 1890, 1891, 1897, 1901, 1904, 1908, 1920, 1925, and for all the years from 1929 to 1936, inclusive. Data on operating units and wholesale and manufacturing trade also were collected for most of these years. In addition to the above, a statistical survey was made of the crab fishery for 1915; the oyster fishery and menhaden industry for 1912; and the shad and alewife fisheries for 1896, 1909, and 1915. The years for which statistics of the shad and alewife fisheries of the Potomac River are available are given in the section entitled "Shad and alewife fisheries."

In the South Atlantic and Gulf States statistics on the catch of the marine fisheries and those conducted in the coastal rivers and bays of these States were collected for the years 1880, 1888, 1889, 1890, 1897, 1902, 1908, 1918, 1923, 1927, 1928, 1929, 1930, 1931, 1932, 1934, and 1936. Data on operating units and wholesale and manufacturing trade also were collected for most of these years. In addition to the above, a

statistical survey was made of the fisheries of these States, excluding Florida and Alabama, for 1887; the shad fishery of the South Atlantic States for 1910; the shad and alewife fisheries of the South Atlantic States for 1896; the sturgeon fishery of Florida for 1900; the menhaden industry of the South Atlantic States for 1912; the shrimp fishery for 1916; the oyster fishery of the South Atlantic States for 1910; and the oyster fishery of the Gulf States for 1911.

In the Pacific Coast States statistics on the catch of the marine fisheries and those conducted in the coastal rivers and bays of these States were collected for the years 1880, 1888, 1892, 1895, 1899, 1904, 1908, 1915, and for all the years from 1922 to 1936, inclusive. These surveys have usually included data on operating units and wholesale and manufacturing trade. In addition to the above, statistics were obtained on the fisheries of California from 1918 to 1921, inclusive, and for the oyster fishery in 1912.

Statistics on the catch of the fisheries of the Great Lakes were collected for the years 1880, 1885, 1890, 1893, 1899, 1903, 1908, and for all the years from 1913 to 1936, inclusive. Statistics of the operating units and of the wholesale and manufacturing trade were collected for most of the years when canvasses were made from 1880 to 1908, and in 1917 and 1922 as well as in most of the years from 1926 to 1936, inclusive. In addition to the above a survey was made of the fisheries of Lake Ontario and of certain fisheries in other lakes for the year 1897.

Statistics of the catch of the fisheries of the Mississippi River and its tributaries were collected for the years 1894, 1899, 1903, 1908, 1922, and 1931. In addition, figures have been obtained of the fisheries of Lakes Pepin and Keokuk for the years 1914 and 1917 and the years from 1927 to 1936, inclusive, and of the fisheries of the Mississippi River between Lakes Pepin and Keokuk for the years 1929 to 1936, inclusive.

Statistics also were collected on the fisheries of certain interior waters, other than the fisheries of the Great Lakes and the Mississippi River and its tributaries, for the years 1894, 1895, 1900, and 1902.

Statistical agents.—The statistics contained in this volume have been collected by a corps of trained statistical and marketing agents which comprises a part of the permanent staff of the Division of Fishery Industries of the Bureau. Most of these men have been with the Bureau for a period of 5 years or more. In the main they are college graduates and were recruited through civil-service examination. While in college, most of the men pursued biological or technical courses, largely in fishery work, which has especially suited them for coping with the many biological and technical aspects encountered in canvassing the fisheries. This training has been especially helpful in identification of the species which, because of the many local names applied to a particular species, causes considerable confusion.

Period covered.—In conducting the fishery statistical surveys, agents are dispatched to the districts to be surveyed as early in the calendar year as they can be spared from the tabulation and preparation for publication of their previous season's work. They collect statistics of fishery operations for the year preceding that in which they are working; and, since their field work occupies the greater part of the year, it is usually at least a year from the end of the calendar year for which they are collecting data until the figures are published. Most of

the figures are collected for the calendar year. Where there are variations from this general practice, explanatory notes appear in the tables. Prior to 1930, statistics on the catch of oysters in the Atlantic and Gulf States were collected for the oyster season; that is, from September to April, inclusive. Beginning with 1930 and down to the present, they have been collected on the basis of the calendar year.

Scope.—The scope of the coastal statistical surveys includes canvasses of the commercial fisheries of the oceans and bays and of the coastal rivers as far inland as commercial fishing is important. This usually coincides with the range of commercial fishing for anadromous species. Statistics of the fisheries of the Mississippi River cover canvasses of the fisheries of the Mississippi River proper as well as all of its tributaries wherein commercial fishing for either fish, crustaceans, or mollusks is prosecuted. Statistics of the fisheries of the Great Lakes cover canvasses of the fisheries prosecuted in the Lakes proper, adjacent bays, and the international lakes of northern Minnesota, as well as rivers which sustain a commercial fishery having outlets into these waters. Surveys for statistics of the wholesale and manufacturing fishery industries cover such plants located in the coastal, river, and lake areas adjacent to the waters mentioned above.

Methods of collection.—Several methods for the collection of fishery statistics are employed, each of which has been carefully studied to obtain the best results with the available personnel and funds. In most instances the agents obtain lists of the names of fishing vessels, names or numbers of motorboats, and names of owners of these craft from local customs officials. Also it often is possible to obtain the names of licensed commercial fishermen and occasionally some statistics on the catch from several of the State fishery agencies; from other State, county, or city agencies; or from private organizations.

With such preliminary records as are available for their guidance the agents then visit each fishing community in their field unless their preliminary records are so complete that personal visits in some areas may be eliminated. While it is impossible for the few agents available for this work to interview each fisherman in a given locality, the more important ones are visited, and a sufficient number of those of lesser importance are interviewed to obtain reliable information on their production. In practice virtually all wholesale firms are visited, as well as captains of fishing vessels (those of 5 net tons or over), and also most of the more important inshore fishermen.

In the Great Lakes and Pacific Coast States such exceptional cooperation has been obtained in recent years from the State fishery agencies in the collection of statistics that only fragmentary surveys need be made by the Bureau's agents to obtain the necessary data. Also the State fishery agencies in Delaware, Maryland, and Virginia recently have developed very complete statistical systems which greatly facilitate the Bureau's canvasses in these States.

As regards the fisheries of the Great Lakes and international lakes of northern Minnesota the Bureau obtains most of the catch statistics and usually the value of the catch direct from the records of the State fishery agency. To obtain data on the number of fishermen, boats, vessels, and gear the Bureau conducts such personal surveys among the fishermen as may be necessary to supplement the State records.

Bureau agents are stationed at Seattle, Wash., and Terminal Island, Calif., who survey the fisheries of the Pacific Coast States. As a rule they obtain figures on the volume of the catch from the records of the several State fishery agencies. In most cases the value of the catch is derived from dealers' records and sometimes from estimates of prices. In Washington and Oregon the offshore fisheries are surveyed separately by the Bureau's agent to obtain data on the number of operating units, catch, and value of the catch. Statistics of the wholesale fishery industry for this section are obtained largely by personal interviews of the agents.

In the administration of the Alaska fisheries the Bureau obtains sworn statements concerning their activities from those prosecuting the fisheries in this area. These statements are compiled by the Alaska Division of this Bureau.

Statistics of the volume of the catch of fish of the Pacific Coast and Great Lakes States are usually shown in weights as landed, which may be in the round or dressed condition. Statistics on the volume of the catch of fish taken in the remainder of the United States are shown in round weight.

The figures in the tables for shellfish represent the weight of the meats in the case of univalve and bivalve mollusks and gastropods, and the round weight of crustaceans and such mollusks as squid and octopus.

Shore and vessel fisheries.—In general, statistics of the shore fisheries, as collected by the agents, include data on the number of casual and regular fishermen; number of motor and other fishing boats and accessory boats; kind and quantity of gear used, and the volume, value, and method of capture of each species caught by boats (for our purpose craft of less than 5 net tons capacity are called "boats") for each locality or group of localities. This method is not followed in some sections where the availability of data collected by the State fishery agencies obviates the necessity of detailed locality surveys.

Statistics of the vessel fisheries include data on the number of the crew, rig of vessels, net tonnage, kind and quantity of gear used, accessory boats carried, and volume, value, and method of capture of each species caught by each vessel (for our purpose craft of 5 net tons' capacity or more are called "vessels"). As in the shore fisheries, the availability of figures collected by State fishery agencies may eliminate the necessity of our agents collecting these data for each vessel.

All persons engaged in commercial fishing operations are included as fishermen. For our purpose these have been divided into "regular" and "casual" fishermen. Regular fishermen are those who receive more than one-half of their annual income from fishing; and casual fishermen are those whose principal business is something other than fishing, and who receive less than one-half of their annual compensation from fishing.

The catch of fish is credited to the principal port of arrival and departure of the craft rather than its point of ownership, registration, documentation, or its port of landing. This accounts for catches of fish being shown in areas where they are not common, since fishing vessels frequently fish in areas far from their principal fishing port.

Wholesale and manufacturing trade.—All persons or firms engaged in the wholesale buying and selling of fishery products or who produce manufactured fishery products are surveyed under this title. Where the business of fishing and wholesaling or manufacturing is combined, that part of the business devoted to either of the latter two phases is included in the wholesale and manufacturing survey and the part devoted to fishing is included in the shore or vessel fisheries. If a wholesale business is conducted with no manufacturing and the business is so small that the full time of one man over the whole year or season is not required, it is then disregarded as a wholesale business. If commodities other than fishery products are handled, the persons engaged, and salaries and wages paid, are prorated; and only that part concerned with fishery products is included. If such a firm required less than the full time of one man over the whole year or season and if it does not manufacture, it is not included in the canvass. Retail firms that manufacture or whose wholesale business exceeds the retail part are included. Persons or firms engaged in the motortrucking of fishery products are included as wholesalers if they are engaged in wholesale buying and selling.

Buyers for a central firm are not canvassed as wholesale dealers unless they ship direct to the firm's customers from the buying point.

Fishermen or fishing concerns, except manufacturers, who do not buy fishery products are not included under this heading except that oyster-shucking firms are included provided shuckers are employed, and irrespective of whether all or part of the oysters used are taken from the firms' privately owned beds.

Manufacturing concerns include those which prepare packaged fishery products; salted, spiced, smoked, dried, or otherwise cured fishery products; canned fishery products; or fishery byproducts.

Fishermen who manufacture are surveyed to obtain the number of persons so employed and the volume and value of the products prepared.

In collecting statistics of manufacturing firms, the agents obtain data on the production for each plant in producing areas of products as marketed by the plant. Such products are usually "final" and in form for consumption; however, the products may be "intermediate" and require further processing before reaching the consumer markets. An outstanding example of an intermediate product is green-salted groundfish which almost invariably is further processed before final marketing. In reviewing the statistics of manufactured products it should be observed that intermediate products are not shown where they are prepared to the final stage in the original plant. An exception to this rule, however, is in the case of the production of mild-cured salmon, which, on account of its importance, is shown in its entirety, whether further processed in the producing plant or not. In this connection it should also be stated that several of the byproducts for which statistics are shown may be intermediate, and the plants producing the final products are not surveyed by this Bureau. Outstanding among such products are marine-animal oils, scrap, and meal.

Statistics of persons engaged in wholesale and manufacturing establishments are reported in three groups: Proprietors, salaried employees, and wage earners.

Proprietors represent those persons who devote their time to the conduct of the enterprise and receive their compensation in the form of profits. Managers of branch houses are not classified as proprietors.

Salaried employees usually include those persons paid by the week or month, while wage earners usually consist of those paid on a per diem or piece-work basis. This, however, is not true in all cases, since the distinction between these two classes depends primarily on the character of the work done rather than the unit of time employed for calculating rates of pay. In general, office employees are classified as salaried employees. Other employees, including plant workmen, are classed as wage earners. Plant foremen or superintendents are classified as salaried employees unless they are principally engaged in manual labor; in which case they are classified as wage earners. Active officers of corporations are classified as salaried employees. Statistics of wage earners are shown in two forms: The average number employed during the operating season; and the average number employed during the year (the monthly average for the year).

Transporting trade.—Statistics are obtained on the number of the crew and number of boats and vessels engaged in transporting fishery products from the fishing grounds to port or from port to port. However, if a craft is engaged in catching fish at any time of the year it is included as a fishing craft rather than as a transporter.

Publication of data.—Statistics of employment in the fisheries, craft and gear engaged, catch and value of catch, and certain data on industries related to the fisheries are summarized and published in bulletin form as soon as possible after completion of each survey. Later the figures in more detail are included in the annual reports of the Division.

LOCAL AND SPECIAL SURVEYS

Landings at certain important United States ports.—Statistics of the landings of aquatic products at the principal New England ports (Boston and Gloucester, Mass., and Portland, Maine) are obtained in a similar manner. An agent is permanently stationed at Boston, Mass., and another is assigned to the ports of Gloucester, Mass., and Portland, Maine. Their duties include the obtaining of figures daily on the quantity of fish landed by each fishing vessel, the value of such fish landed, information concerning the date of departure and arrival of the vessel, and they also indicate the grounds from which the fish were taken and gear used in their capture. These data are forwarded to the Bureau, where compilations are made. Products of American fisheries received duty free at Boston and Gloucester, Mass., and Portland, Maine, from the treaty coasts of Newfoundland, Magdalen Islands, and Labrador are included in the landings at these ports; however, they are not included in the catch in sectional fishery surveys of the New England States unless they represent a catch by United States vessels. Statistics of these landings are released monthly and annually in bulletin form and detailed data are published in the annual reports of this Division. Data on the landings at Boston, and Gloucester, Mass., have been collected annually since 1893, and those for Portland, Maine, since June 1915. Some data are available for Boston and Gloucester prior to 1893.

Statistics of the landings of fish at Seattle, Wash., are collected by the Bureau's agent in that city. Landings are classified as those

made by United States fishing vessels and those received by Seattle wholesale dealers. The landings credited to United States fishing vessels are made by vessels operating distinctly as primary fishing units, usually in the offshore fisheries, while those credited as received by wholesale dealers are usually products of the shore fisheries collected mainly from points in Puget Sound and do not include fish received from Alaska or Canada, or landings made by the halibut fleet. Statistics of these landings at Seattle are released monthly and annually in bulletin form and detailed data are published in the annual reports of this Division. Statistics of the landings by fishing vessels at Seattle have been collected since June 1915 and certain data on products received by Seattle wholesale dealers since December 1915.

Statistics of the fishery products handled at the municipal wharf, Washington, D. C., are reported to the Bureau by agents of the Health Department in Washington. They are not published in bulletin form, but a summary of the year's activities is published in the annual reports of the Division. Data on products handled at the municipal wharf are available since 1921.

Atlantic mackerel fishery.—Statistics on the catch by the Atlantic mackerel fleet are obtained by combining the figures of mackerel landed at Boston and Gloucester, Mass., and Portland, Maine, with those obtained by Bureau agents, who in recent years have been stationed at other Atlantic ports where mackerel are landed. These agents obtain data on the volume of mackerel landed in a manner similar to that used to obtain figures on the landings by fishing vessels at the three New England ports. The figures include only the catches made by purse seine and drift gill net craft and are not complete for craft of under 5 net tons' capacity using this type of gear. Statistics of this fishery appear only in the annual reports of this Division, although the landings at the principal New England ports appear in the monthly and annual bulletins published for those ports. Statistics of this fishery are available from 1905 to 1936, inclusive.

Shad and alewife fisheries.—Owing to the importance of the Hudson and Potomac Rivers in the production of shad, surveys for statistics of the catch, value of the catch, and operating units are made annually. On the Potomac River similar statistics also are obtained for the alewife fishery. Much of the data required for these surveys are available from the State fishery agencies.

Statistics of the shad and alewife fisheries are not published separately in bulletin form, but a summary of the year's activities is published in the annual reports of the Division.

Statistics of the shad fishery of the Hudson River are available for 1896, 1897, 1898, 1901, 1904, 1910, and from 1915 to 1936, inclusive, while data for the shad fishery of the Potomac River are available for 1896, 1901, 1904, 1909, 1915, and from 1919 to 1936, inclusive. Statistics of the alewife fishery of the Potomac River are available for 1896, 1909, 1915, and from 1919 to 1936, inclusive.

Pacific halibut fishery.—Statistics of the Pacific halibut fishery are obtained by the Bureau's agent in Seattle, aided by Bureau representatives in Alaska and the International Fisheries Commission. The fleet classification has been arbitrarily applied by including in the "Washington fleet" all United States and Alaska vessels that land more than half of their catch in that State. All other United States and Alaska vessels of the halibut fleet are included in the "Alaska

fleet." Monthly and annual statistical bulletins are available on this fishery, being published along with the statistics of the landings of fishery products at Seattle, Wash., and detailed statistics are published in the annual reports of the Division. Statistics of the landings of halibut at Pacific coast ports have been collected since 1925.

Canned fishery products and byproducts.—Beginning in 1921, the Bureau has made annual surveys for statistics of the canned fishery products and byproducts industries of every section. These are begun the first week in January of each year for statistics of the production in the preceding year. The surveys usually occupy 6 to 9 weeks' time. During this period the Bureau obtains by mail, so far as possible, the production of canned fishery products or byproducts from each plant in the United States engaged in this business. Where it is impossible to obtain reports by mail the report is obtained by personal visit by the Bureau's agents. They obtain statistics of the production and value of the production for each commodity. Statistics of the canned fishery products and byproducts produced in Alaska are received on the same statements obtained by the Bureau that include statistics of general fishery operations.

An annual statistical bulletin is issued on this trade, and detailed statistics of the output are published in the annual reports of the Division. In addition to the data obtained on the output of these products annually since 1921, data also usually were obtained prior to 1921 for the years the various sections were surveyed.

The value shown for canned products constitutes the gross amount received by the packer at the production point, no deductions being made for commission or expenses.

Packaged-fish trade.—Complete statistics of the annual production and value of fish packaged in the United States are obtained as a part of the survey for the statistics of the canned fishery products and byproducts industries. These statistics are released in bulletin form annually and detailed statistics are published in the annual reports of the Division. Statistics of the production of packaged fish are available for 1926 and the years from 1928 to 1936, inclusive.

Cold-storage holdings of fish.—An arrangement has been made with the Bureau of Agricultural Economics, Department of Agriculture, whereby statistics of the cold-storage holdings of the various species of fish, by sections of the United States are furnished to this Bureau monthly. Included with statistics of the holdings are statements of the quantity of the various species of fish frozen and also the holdings of certain cured fish. Bulletins showing these statistics are issued monthly as well as annually, and detailed statistics are published in the annual reports of this Division. Statistics of cold-storage holdings of fishery products have been published since 1917 and data on quantities of fish frozen, for the years from 1920 to 1925, inclusive, and from 1928 to 1936, inclusive.

Sponge market, Tarpon Springs.—A large proportion of the total output of sponges in Florida is handled through the sponge exchange at Tarpon Springs. In view of this, the Bureau has obtained from a representative of the exchange annual statistics of the quantity and value of the sponges, by variety classification, handled through it annually. Statistics of the quantity of sponges handled through the exchange are not published in bulletin form, but a summary of the year's activities is published in the annual reports of this Division.

Statistics of the transactions on the sponge exchange are available for 1913, 1914, and for the years from 1917 to 1936, inclusive.

Foreign fishery trade.—Statistics of the foreign fishery trade are obtained from compilations made by the Bureau of Foreign and Domestic Commerce, Department of Commerce. Statistics of all known fishery products imported or exported have been assembled in one table and published annually in the reports of the Division in recent years. For earlier years they are available in the reports of the Bureau of Foreign and Domestic Commerce, the Bureau of Statistics, the Department of Commerce and Labor, or the Treasury Department.

PRACTICES AND TERMS

Certain practices and terms of importance used in the compilation of fishery statistics are explained below.

Days absent.—In computing "days absent" for vessels landing fares at the various ports, the day of departure and the day of arrival are included; thus a vessel leaving port on the 8th of the month and returning on the 15th of the month will be shown as being absent 8 days.

Operating units.—Operating units as referred to in this document include persons engaged in the fisheries, and fishing craft and gear employed.

Vessel.—The term "vessel" refers to a craft having a capacity of 5 net tons or more.

Boat.—The term "boat" refers to a craft having a capacity of less than 5 net tons.

Incidental catch.—The term "incidental catch" refers to the catch of certain species by a type of gear which ordinarily does not capture such species.

Percentages.—Percentages are usually shown as whole numbers. Fractions of percents are dropped if less than five-tenths, and the percentage is raised to the next higher integer if the fraction is greater than five-tenths. If the fraction is exactly five-tenths, the integer is raised or lowered to make it an even number.

Converting.—Many of the figures shown in the statistical tables published herewith have been converted to thousands of pounds or dollars. In making these conversions the largest number from which a group of items is computed is raised or lowered to the nearest thousands place. If the number ends in an even 500, the thousands integer is raised or lowered to make it an even number. The individual items are changed to conform to the total thus obtained.

Confidential data.—The statistical data collected by the Division are confidential and are not released except by approval of the Washington office. Statistics of production of wholesale and manufacturing firms are published only for commodities or geographical areas where the production of three or more concerns may be grouped. Every effort is made to publish only those figures which will not reveal individual enterprise.

CONVERSION FACTORS

It is the policy of the Bureau to show the detailed catch figures of all products in pounds for the sake of uniformity and for purposes of

comparison. Following such a policy presents certain problems. In the case of fish there is little difficulty since in very rare instances are such products reported in units of measure other than pounds. For shellfish, however, the units of measure may be bushels, sacks, barrels, or thousands of shellfish, gallons of meats, etc. These many units make standardization difficult, but when coupled with the wide variation in the requirements or definition of some of these units in the various States the problem becomes even more complex.

All bivalve mollusks are reported in pounds of meats in the detailed catch tables presented in this report. In addition, there are included supplementary tables for most of the sections, which give data on the production in bushels. These supplementary tables also give the production of certain other shellfish, such as crabs, in number.

Oysters.—Probably the greatest problem in presentation of fishery statistics in uniform units of measure is in the case of oysters. Usually the production of oysters on the Atlantic and Gulf coasts is reported to Bureau agents in bushels; and prior to the data obtained for the year 1930 conversion from bushels to pounds of meats was effected on the basis of a uniform yield of 7 pounds of meats to the bushel. However, more recent investigations have shown considerable variation from this figure. There follows a table which gives the results of these studies of the measures used for oysters in the various States and of the average yields per bushel. This table presents the factors that have been used in the oyster statistics given in this report.

Measures and yields of oysters ¹

State	Capacity of State bushel	Variation from United States standard bushel		Market oysters	
		Yield per State bushel	Yield per standard bushel	Yield per State bushel	Yield per standard bushel
	<i>Cubic inches</i>	<i>Cubic inches</i>	<i>Percent</i>	<i>Pounds of meats</i>	<i>Pounds of meats</i>

¹ Data for the Chesapeake, and South Atlantic and Gulf States are for 1936. Other data are for 1935.

Other conversion factors.—The principal other conversion factors that have been used in this report are as follows:

Alewives.....	To convert number of fish to weight in pounds, multiply by 0.4.
Cod, large, salted.....	To convert to fresh-gutted weight, multiply by 1.90.
Cod, market, salted.....	To convert to fresh-gutted weight, multiply by 1.94.
Cod, scrod, salted.....	To convert to fresh-gutted weight, multiply by 1.98.
Crustaceans:	
Crabs, soft and peelers (Connecticut, New York, New Jersey, Delaware, Maryland, and Virginia).	To convert number of crabs to weight in pounds, divide by 4.
Crabs, soft and peelers (Louisiana).	To convert number of crabs to weight in pounds, divide by 2.9.
Crabs, soft and peelers (other States).	To convert number of crabs to weight in pounds, divide by 3.
Crabs, hard (Georgia, North Carolina, and South Carolina).	To convert number of crabs to weight in pounds, divide by 2.
Crabs, hard (Florida).....	To convert number of crabs to weight in pounds, divide by 2.01.
Crabs, hard (Alabama).....	To convert number of crabs to weight in pounds, divide by 2.06.
Crabs, hard (Mississippi)---	To convert number of crabs to weight in pounds, divide by 2.18.
Crabs, hard (Louisiana)----	To convert number of crabs to weight in pounds, divide by 2.15.
Crabs, hard (Texas)-----	To convert number of crabs to weight in pounds, divide by 2.30.
Crabs, hard (other Atlantic Coast States)	To convert number of crabs to weight in pounds, divide by 3.
Cusk, salted.....	To convert to fresh-gutted weight, multiply by 1.90.
Haddock, large, salted.....	To convert to fresh-gutted weight, multiply by 2.06.
Haddock, scrod, salted.....	To convert to fresh-gutted weight, multiply by 2.10.
Hake, large, salted.....	To convert to fresh-gutted weight, multiply by 1.90.
Hake, small, salted.....	To convert to fresh-gutted weight, multiply by 1.98.

Halibut, salted.....	To convert to fresh-gutted weight, multiply by 2.
Herring, salted.....	To convert to round weight, multiply by 1.50.
Mackerel, salted.....	To convert to round weight, multiply by 1.35.
Menhaden.....	To convert number of fish to weight in pounds, multiply by 0.6.
Pollock, salted.....	To convert to fresh-gutted weight, multiply by 1.90.
Sponges, dried (Florida):	
Large wool.....	To convert number of bunches to weight in pounds, multiply by 3.5.
Medium wool.....	To convert number of bunches to weight in pounds, multiply by 1.75.
Small wool.....	To convert number of bunches to weight in pounds, multiply by 1.
Wool rags.....	To convert number of bunches to weight in pounds, multiply by 2.25.
Grass.....	To convert number of bunches to weight in pounds, multiply by 1.
Wire.....	To convert number of bunches to weight in pounds, multiply by 1.5.
Yellow.....	To convert number of bunches to weight in pounds, multiply by 1.25.

COMMON AND SCIENTIFIC NAMES OF FISHERY PRODUCTS

In order to prevent misunderstanding in the use of common names employed in the tables and discussions, the following list of common and scientific names is given:

Common and scientific names of the commercial fishery products caught in the United States and Alaska

Common name as shown in Bureau reports	Other common names	Scientific names
Albacore.....	See tuna.	<i>Pomolobus pseudoharengus.</i>
Alewives.....	Branch herring, wall-eyed or big-eyed herring.	<i>Pomolobus zstivalis.</i>
Amberjack.....	Blueback, glut herring.....	Seriola species. <i>Engraulis mordax.</i>
Anchovies.....		<i>Anchoiella delicatissima.</i> <i>Anchoiella compressa.</i>
Angelfish.....		<i>Pomacanthus arcuatus.</i> <i>Angelichthys isabelita.</i>
Barracuda.....		<i>Sphyræna argentea.</i>
Black bass.....	Smallmouth bass.....	<i>Micropterus dolomieu.</i>
Bluefish.....	Largemouth bass.....	<i>Micropterus salmoides.</i>
Blue pike.....	Tailor.....	<i>Pomatomus saltatrix.</i>
Blue runner or hardtail.....	Pike perch, blue pickerel (Canada).....	<i>Stizostedion glaucum.</i>
Bonito.....	Runner.....	<i>Caranx crysos.</i> <i>Sarda sarda.</i>
Bowfin.....		<i>Sarda chiliensis.</i>
Buffalofish.....		<i>Amia calva.</i>
Butterfish.....		Ictiobus species.
Burbot.....	Lawyer, ling.....	<i>Poromotus triacanthus.</i>
Cabio.....	Coalfish, crab eater, cobia.....	<i>Lota maculosa.</i>
Cabrilla.....	Rock bass.....	<i>Rachycentron canadus.</i>
Carp.....	German carp.....	<i>Epinephelus analogus</i> (Pacific coast). <i>Cyprinus carpio.</i>
Catfish and bullheads.....		Ameiurus species. Ictalurus species. <i>Leptops olivaris.</i>
Chubs.....	Tullibee in Canada; longjaw, bluefin, blackfin in United States.	All <i>Leucichthys</i> except <i>artedi</i> (in Great Lakes).
Cigarfish.....	Scad.....	<i>Decapterus punctatus.</i>
Cisco.....	Herring in Canada.....	<i>Leucichthys artedi</i> (Lake Erie only).
Cod.....	Codfish.....	<i>Gadus macrocephalus</i> (Pacific coast). <i>Gadus callarias</i> (Atlantic coast).
Crappie.....	White crappie.....	<i>Pomoxis annularis.</i>
Crevalle.....	Black crappie, strawberry bass, calico bass.....	<i>Pomoxis sparoides.</i>
Croaker.....	Crocus, hardhead.....	<i>Caranx hippos.</i> <i>Micropogon undulatus.</i>

Common and scientific names of the commercial fishery products caught in the United States and Alaska—Continued

Common name as shown in Bureau reports	Other common names	Scientific names
Cunner.....	Chogset, blue perch, bergall.....	<i>Tautoglabrus adspersus</i> .
Cusk.....		<i>Brosme brosme</i> .
Dolly Varden trout.....	Salmon trout, bull trout.....	<i>Salvelinus parkei</i> .
Dolphin.....		<i>Coryphaena hippurus</i> .
Drum:		
Black.....		<i>Pogonias cromis</i> .
Red.....	Channel bass, redfish, spotted bass.....	<i>Sciaenops ocellatus</i> .
Eels:		
Common.....		<i>Anguilla rostrata</i> .
Conger.....		<i>Leptocephalus conger</i> .
Flounders.....	Flounders, flukes, soles, "California halibut," dabs.....	Pleuronectidae species.
Flyingfish.....		<i>Cypsilurus californicus</i> .
Frigate mackerel.....	"Boo Hoo".....	<i>Auzis thazard</i> .
Garfish.....	See sea gar.....	
Gizzard shad.....	Nanny shad, mud shad.....	<i>Dorosoma cepedianum</i> .
Goldeye.....		Hiodon species.
Goldfish.....	Sand perch.....	<i>Carassius auratus</i> .
Goosefish.....	Allmouth.....	<i>Lophius piscatorius</i> .
	Dogfish.....	<i>Squalus sucktii</i> (Pacific coast).
Grayfish.....	Spiny dog.....	<i>Squalus acanthias</i> .
	Smooth dog.....	<i>Mustelus mustelus</i> .
Groupers.....	"Sea bass".....	(<i>Epinephelus</i> species).
Grunts.....		<i>Myceteroperca</i> species.
Haddock.....	Margatefish, sailors choice (Key West).....	<i>Haemulon</i> species.
		<i>Melanogrammus aeglefinus</i> .
Hake.....	Squirrel hake, Boston hake, ling, black hake, mud hake.....	<i>Urophycis</i> species (Atlantic coast).
	Merluccio.....	
Halibut.....		<i>Merluccius productus</i> (Pacific coast).
Hardhead.....		<i>Hippoglossus hippoglossus</i> .
Harvestfish.....	Starfish, dollarfish, pappyfish; butterflyfish (N. C.).....	<i>Orthodon microlepidotus</i> (Pacific coast).
		<i>Peprilus alepidotus</i> .
Herring:		
Lake.....	Herring.....	<i>Leucichthys artedi</i> (Great Lakes, except Erie).
Round.....		<i>Etrumeus sadina</i> .
Sea.....		(<i>Clupea harengus</i> (Atlantic coast).
		(<i>Clupea pallasii</i> (Pacific coast).
Herring smelt.....	Sea smelt.....	<i>Argentina silus</i> .
Hickory shad.....	Tailor shad, skip.....	<i>Pomotobus mediocris</i> .
Hogfish.....	Capitaine, perro perro.....	<i>Lachnolaimus maximus</i> (Florida).
	Pacific.....	<i>Trachurus symmetricus</i> .
	Atlantic—See tuna.....	
Horse mackerel.....		
Jewfish.....		<i>Promicrops itaiara</i> .
		(<i>Scomberomorus cavalla</i> (Atlantic coast).
		(<i>Scomberomorus regalis</i> (Atlantic coast).
Kingfish.....	King mackerel, cerro.....	<i>Genyonemus lineatus</i> (California).
	Little roncoader, croaker.....	<i>Menticirrhus</i> species.
King whiting.....	Northern whiting, kingfish, sea mink.....	<i>Cristivomer namaycush</i> .
Lake trout.....		<i>Petromyzon marinus</i> .
Lamprey.....		<i>Ammodytes americanus</i> .
Launce.....	Sand eel, lant, sand launce.....	<i>Ophiodon elongatus</i> .
"Lingcod".....	Cultus cod, blue cod, buffalo cod, ling.....	(<i>Scomber scombrus</i> (Atlantic coast).
		(<i>Scomber diego</i> (Pacific coast).
Mackerel.....		<i>Tetrapturus mitsukurii</i> (Pacific coast).
Marlin.....	Spearfish.....	<i>Brevoortia tyrannus</i> .
Menhaden.....	Mossbunker, poggy, fatback.....	<i>Cyprinidae</i> species.
Minnnows.....		<i>Eucinostomus</i> species.
Mojarra.....		Hiodon species.
Mooneye.....	Toothed herring.....	(<i>Vomer setipinnis</i> .
		(<i>Selene vomer</i> .
Moonfish.....		<i>Mugil</i> species.
Mullet.....	Jumping mullet.....	<i>Fundulus</i> species.
Mummichog.....	Mayfish, killifish.....	<i>Lutjanus analis</i> .
Muttonfish.....		<i>Polyodon spathula</i> .
Paddlefish.....	Spoonbill cat.....	
Perch (California).....	See surfishes.....	
Permit.....	See pompano.....	
Pigfish.....	Hogfish (N. C.).....	<i>Orthopristis chrysopterus</i> .
Pike or pickerel.....	Great Lakes pike.....	(<i>Esox reticulatus</i> .
		(<i>Esox lucius</i> .
Pilchard.....	Sardine.....	<i>Sardina caerulea</i> .
Pilotfish.....		(<i>Naucrates ductor</i> .
		(<i>Seriola zonata</i> .
Pinfish.....	Bream, salt-water bream.....	<i>Lagodon rhomboides</i> .
Pollock.....		<i>Pollachius virens</i> .
	Permit, great pompano.....	<i>Trachinotus goodii</i> .
Pompano.....		<i>Trachinotus</i> species (Atlantic coast).
		<i>Patometa similima</i> (Pacific coast).
Porgies.....	Porgee.....	<i>Calamus</i> species.
Porkfish.....	Sisi.....	<i>Anisotremus virginicus</i> .

Common and scientific names of the commercial fishery products caught in the United States and Alaska—Continued

Common name as shown in Bureau reports	Other common names	Scientific names
Quillback	Spearfish or skimfish	<i>Carpiodes</i> species.
Roach	Shiner	<i>Noteimigonus crysoleucas</i> .
Rock bass	Redeye, goggle-eye	<i>Ambloplites rupestris</i> (Mississippi River to Atlantic seaboard).
Rockfishes	(Groupers)	<i>Paralabrax nebulifer</i> (Pacific coast).
Rosefish	Rock cod	<i>Sebastes</i> species (Pacific coast).
Rudderfish	(Blue bass, greenfish)	<i>Sebastes marinus</i> .
Sablefish	(Halfmoon)	<i>Girella nigricans</i> (Pacific coast).
Salmon:	Black cod	<i>Medialuna californiensis</i> (Pacific coast).
Atlantic		<i>Anoplopoma fimbria</i> .
Pacific:		<i>Salmo salar</i> (Atlantic coast).
Blueback, red, or sockeye.		<i>Oncorhynchus nerka</i> .
Chinook or king	Tyee, spring	<i>Oncorhynchus tshawytscha</i> .
Chum or keta	Dog salmon	<i>Oncorhynchus keta</i> .
Humpback or pink.		<i>Oncorhynchus gorbuscha</i> .
Silver or coho		<i>Oncorhynchus kisutch</i> .
Steelhead	See steelhead trout.	
Sauger	Sand pike	<i>Stizostedion canadense</i> .
Sculpin		Cottidae species.
Scup	Paugy or porzy, fair maid	<i>Stenotomus</i> species.
Sea bass	Black jewfish or black sea bass	<i>Stereolepis gigas</i> (Pacific coast).
	Black sea bass, blackfish	<i>Centropristis striatus</i> (Atlantic coast).
	White sea bass	<i>Cynoscion nobilis</i> (Pacific coast).
	Gafftopsail	<i>Isagre marina</i> .
Sea catfish		<i>Prionotus</i> species.
Sea robin		<i>Mora sapidissima</i> .
Shad	American shad	<i>Carcharodon</i> species; <i>Mustelus</i> species;
Sharks		<i>Carcharhinus</i> species; <i>Sphyrna</i> species;
		<i>Archosargus probatocephalus</i> (Atlantic coast).
Sheepshead		<i>Archosargus unimaculatus</i> (Florida).
	Drum, fresh water	<i>Aplodinotus grunniens</i> (fresh water).
Sheepshead, California	Redfish, fathead	<i>Pimelometopon pulcher</i> .
Silver perch	Sand perch	<i>Bairdiella chrysura</i> .
Silversides	Spearing	<i>Memidia</i> species.
Skates		<i>Raja</i> species.
Skipper	Billfish	<i>Scomberus saurus</i> .
Smelts		<i>Osmerus mordax</i> (Atlantic coast).
	Eulachon	Argentinidae species (Pacific coast).
Snapper:		<i>Thalichthys pacificus</i> .
Mangrove	Gray snapper	<i>Lutjanus griseus</i> .
Red		<i>Lutjanus blackfordii</i> .
Snook	Robalo, sergeantfish	<i>Centropomus undecimalis</i> .
Spadefish	Porgy (N. C.)	<i>Chaetodipterus faber</i> .
Spanish mackerel		<i>Scomberomorus maculatus</i> .
Spittail		<i>Pogonichthys macrolepidotus</i> .
Spot	Lafayette, goody	<i>Leiostomus xanthurus</i> .
Squawfish	Sacramento pike	<i>Ptychocheilus grandis</i> .
Squeteague:		
Gray	Gray trout, weakfish, trout	<i>Cynoscion regalis</i> .
Spotted	Spotted weakfish, spotted trout	<i>Cynoscion nebulosus</i> .
White	Sand trout	<i>Cynoscion arenarius</i> .
Squirrel hake	See hake	
Steelhead trout	Salmon trout	<i>Salmo gairdneri</i> .
Striped bass	Rockfish, rock	<i>Roccus lineatus</i> .
Sturgeon		<i>Acipenser</i> species.
Sturgeon, shovelnose		<i>Scaphirhynchus platyrhynchus</i> .
Sucker	Fresh-water mullet	Catostomidae species.
Sunfish	Bream, perch	(<i>Lepomis</i> species.
Surffishes	Perch	Centrarchidae species.
Swellfish	Puffer, swell toad, balloonfish, globe-fish.	Embiotocidae species.
		<i>Spheroides maculatus</i> .
Swordfish		<i>Xiphias gladius</i> .
Tautog	Blackfish, oysterfish	<i>Tautoga onitis</i> .
Tenpounder	Elops	<i>Elops saurus</i> .
Thimble-eyed mackerel	Bullseye	<i>Scomber colias</i> .
Tilefish		<i>Lopholatilus chamaeleonticeps</i> .
Tomcod		(<i>Microgadus tomcod</i> (Atlantic coast).
Tripletail		<i>Microgadus proximus</i> (Pacific coast).
Tullibees	See chubs.	<i>Lobotes surniamensis</i> .
Tuna and tunalike fishes:		
Albacore	Longfin tuna	<i>Germo alalunga</i> .
Bluefin	(Tuna, leaping tuna (Pacific coast)	<i>Thunnus salsus</i> .
	("Horse mackerel" (Atlantic coast)	<i>Thunnus thynnus</i> .
		<i>Thunnus secundodorsalis</i> .

Common and scientific names of the commercial fishery products caught in the United States and Alaska—Continued

Common name as shown in Bureau reports	Scientific names	Other common names
Tuna and tunalike fishes—Continued.		
Bonito.....		{ <i>Sarda sarda</i> (Atlantic coast). { <i>Sarda chiliensis</i> (Pacific coast).
Skipjack.....	Striped tuna.....	<i>Euthynnus pelayms</i> .
Yellowfin.....		<i>Neohunnus macropterus</i> .
Turbot.....	{Greenland halibut.....	<i>Reinhardtius hippoglossoides</i> (off New England.)
	{American turbot, triggerfish.....	<i>Balistes carolinensis</i> (off Florida).
Wahoo.....		<i>Acanthocybium solandri</i> .
White bass.....	White lake bass.....	<i>Roccus chrysops</i> .
Whitebait.....	Small fry of several species.....	
Whitefish:		
Common.....		{ <i>Coregonus clupeiformis</i> (Great Lakes).
Menominee.....		{ <i>Caulolatilus princeps</i> (Pacific coast).
White perch.....		<i>Prosopium quadrilaterale</i> .
Whiting.....	Silver hake.....	<i>Morone americana</i> (Atlantic coast).
Wolfish.....		<i>Merluccius bilinearis</i> .
Yellow perch.....		<i>Anarhichas lupus</i> .
Yellow pike.....		<i>Perca flavescens</i> .
Yellowtail.....	Wall-eyed pike, pike perch, dore.....	<i>Stizostedion vitreum</i> .
		{ <i>Ocyurus chrysurus</i> (Atlantic coast).
		{ <i>Seriola dorsalis</i> (Pacific coast).
Crabs:		
Hard.....	{Hard-shell crab, blue crab.....	<i>Callinectes sapidus</i> .
	{Dungeness crab.....	<i>Cancer magister</i> (Pacific coast).
	{Rock crab, hard crab.....	<i>Cancer irroratus</i> (Atlantic coast).
Soft and peelers.....	Soft-shelled crab, blue crab.....	<i>Callinectes sapidus</i> .
King.....		<i>Paralithodes camtschatica</i> (Pacific coast).
King or horseshoe.....		<i>Limulus</i> (Atlantic coast).
Stone.....		<i>Menippe mercenaria</i> .
Crawfish:		
Fresh water.....	Crayfish.....	{ <i>Cambarus</i> species (Atlantic coast).
		{ <i>Astacus</i> species (Pacific coast).
Sea.....	Rock lobster, crayfish.....	{ <i>Panulirus argus</i> (Atlantic coast).
		{ <i>Panulirus interruptus</i> (Pacific coast).
Lobsters:		
Common.....		<i>Homarus americanus</i> (Atlantic coast).
Spiny.....	(See sea crawfish.)	
Shrimp.....		{ <i>Peneus setiferus</i> .
		{ <i>Peneus brasiliensis</i> (Atlantic and Gulf coasts).
		{ <i>Pandalus</i> species (Pacific coast).

		{ <i>Crangon</i> species (Pacific coast).
		{ <i>Halotis</i> species.
Abalone.....		
Clams:		
Cockle.....		<i>Cardium corbis</i> (Pacific coast).
		<i>Saxidomus nuttall</i> .
Hard.....	{Butter.....	{ <i>Tivela stultorum</i> (Pacific coast).
	{Round clam, cherrystone, quahog, little neck.....	{ <i>Venus mercenaria</i> (Atlantic coast).
		{ <i>Venus mortoni</i> (Florida coast).
Pismo.....		<i>Tivela stultorum</i> (Pacific coast).
Razor.....		{ <i>Ensis</i> species (Atlantic coast).
Soft.....	Soft shell clam, sand clam, nannynose, maninose.....	{ <i>Siliqua patula</i> (Pacific coast).
		<i>Mya arenaria</i> .
Surf.....	Skimmer.....	<i>Macra solidissimo</i> .
Cockles.....	Moonshell.....	<i>Natica heros</i> (Atlantic coast).
Conchs.....		{ <i>Strombus</i> species.
		{ <i>Busycon</i> species.
Coquina.....	Pompano shells.....	<i>Donax variabilis</i> .
Mussels:		
Sea.....		{ <i>Mytilus californianus</i> (Pacific coast).
		{ <i>Mytilus edulis</i> .
		{ <i>Quadrula</i> species.
		{ <i>Lampsilis</i> species.
		{ <i>Unio</i> species.
		{ <i>Symphynota</i> species.
		{ <i>Octopus punctatus</i> (Pacific coast).
Octopus.....		
Oysters:		
Eastern.....		<i>Ostrea virginica</i> .
Western.....	Olympia.....	<i>Ostrea lurida</i> (Pacific coast).
Japanese (introduced). Pacific.....		<i>Ostrea gigas</i> .
Periwinkles.....		<i>Littorina</i> species.
Scallops:		
Bay.....		{ <i>Pecten irradians</i> (Atlantic coast).
		{ <i>Pecten aquisulcatus</i> (Pacific coast).
Sea.....		<i>Pecten magellanicus</i> .
Squid.....		{ <i>Loligo opalescens</i> (Pacific coast).
		{ <i>Loligo pealei</i> (Atlantic coast).

Common and scientific names of the commercial fishery products caught in the United States and Alaska—Continued

Common name as shown in Bureau reports	Scientific names	Other common names
Sea urchins.....		Echinoidea.
Terrapin.....	Diamond-back terrapin.....	Malaclemmys species.
Turtles:		
Green.....		<i>Chelonia mydas.</i>
Loggerhead.....		<i>Thalassochelys caretta.</i>
Hawksbill.....		<i>Chelonia inbriicata.</i>
Snapping.....	Hard shell, alligator turtle.....	{ <i>Chelydra serpentina.</i>
Soft shell.....		<i>Macrochalys lacertina.</i>
Frogs.....		Trionyx species.
Irish moss.....		Rana species.
Kelp.....		<i>Chondrus crispus.</i>
		Macrocystis species; Nereocystis species; Pelagophycus species; Alaria species.
Sponges:		
Glove.....		<i>Spongia graminea</i> (Hyatt) <i>Euspongia officianalis</i> (L.).
Grass.....		<i>Hippospongia equina cerebriformis.</i>
Sheepswool.....		<i>Hippospongia canaliculata gossypina.</i>
Yellow.....		<i>Hippospongia equina elastica.</i>
Trepang.....	Sea cucumber.....	<i>Cucumaris frondosa.</i> <i>Thyone briareus.</i>
