### **SECTION 3 - MIDDLE ATLANTIC FISHERIES**

The 1961 commercial landings of fish and shellfish in the coastal areas of the Middle Atlantic States (New York, New Jersey, and Delaware) amounted to 825 million pounds valued at \$24 million to the fishermen. Compared with the previous year, this was an increase of 42 million pounds (5 percent) and \$2 million (10 percent). The gain in volume was due to increased landings of menhaden while menhaden and oysters accounted for the higher value.

A comparison of landings by States shows that New Jersey led with 48 percent of the total volume for the Middle Atlantic States. Delaware was second, with 37 percent, while New York accounted for the remaining 15 percent. The ranking by value of landings was: New Jersey, 46 percent, New York, 38, and Delaware, 16 percent.

During the year, 8,559 fishermen participated in making the catch. These fishermen utilized 602 vessels and 4,123 other craft—a decrease of 19 vessels, but an increase of 227 fishermen compared with 1960. The additional fishermen were employed in the shore and boat fishery.

Manufactured fishery products were valued at \$92 million—\$11 million more than the 1960 production. In terms of value, this was a record year, due primarily to an increase in the production of menhaden products, breaded products, and canned fishery items.

Increased landings of oysters were recorded for the first time since 1950. In that year, 18.2 million pounds of meats were landed in the Middle Atlantic States. Since then, declines have been registered each year, until 1961, when landings totaled 1.9 million pounds of meats, or an increase of 66 percent over 1960. Among the many factors that contributed to the decline were poor sets, starfish depredation in Long Island Sound, a general shortage of seed oysters; and, beginning in 1957, a severe blight of Delaware Bay oysters from an organism commonly referred to as MSX. The Delaware Bay seed oyster beds, which were legally closed in 1959 as a protective measure, were reopened in 1961. Bay plantings prospered, and there was optimism that MSX may have run its course. The catch of 1 million pounds from the Bay was a direct result of renewed seed plantings.

The production of surf clams in the Middle Atlantic States (27.4 million pounds of meats) increased 2.8 million pounds and set a record for the third consecutive year. New Jersey vessels accounted for 97 percent of the landings, and the new record is attributed to the addition of four vessels to the surf clam fleet. This is an example of a fishery which has been completely market-controlled as supply problems have not yet arisen. Because market acceptance increases each year, greater demands will be made of the fishing grounds, and studies are now being considered to determine the catch potential.

While the overall production of hard clams declined only about 5 percent, the catch in New Jersey was adversely affected by the occurrence of hepatitis among the local population. Early in the season, an outbreak of infectious hepatitis was linked to clams as a possible source of infection. Several important producing areas of New Jersey were closed by the shellfish sanitation agency, and market acceptance of clams from adjoining areas was limited. The New Jersey clam production fell 34 percent as a result of these factors. New York clams weathered the hepatitis scare and by year's end, production was up 10 percent.

Landings of hard crabs decreased 2 million pounds to the lowest level since 1945. Crabs were small in size, and the price was very low. Pot fishermen had to delay the season until crabs reached a marketable size, and the dredgers who operated during the winter months found fishing unprofitable and ceased operations within a week or two.

During the year, a small dehydration plant was set up to produce meal from horseshoe crabs, which were gathered by hand along the beaches where they were found in large numbers after storms. This supplied work for some unemployed oystermen. Unfortunately, the operation had little more than started when the plant was destroyed by fire. However, enough crabs were harvested to nearly double the 1960 landings of this species.

Menhaden accounted for 87 percent of the total volume and 33 percent of the value of Middle Atlantic landings in 1961. Although clam meats were only 4 percent of the volume of the landings, they were 22 percent of the value.

Sea bass production declined nearly 1 million pounds (34 percent) to the lowest level recorded since 1921. This fishery has been on the downgrade in recent years presumably because of a failure of year-classes.

Striped bass were abundant in all areas. New York, the best producing State of the Middle Atlantic, had the highest commercial catch (910,000 pounds) ever recorded for the State. The fish were mostly of a single year-class which entered the fishery during the year. Haul seines took the greatest quantities, but inshore trawlers also caught an unusual number.

A sharp increase in the catch of yellowtail flounders was primarily attributed to the expansion of processing and landing facilities on Long Island. These facilities are within a short distance of the most important fishing grounds for this species.

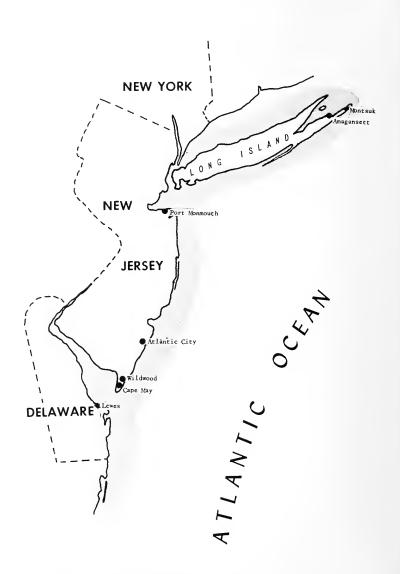

Cod landings dropped considerably due to the freezing over of New Jersey harbors for a period of 2 weeks during the peak of the season. Also, the fish were less abundant and found in areas farther offshore than the previous year, thus limiting the line trawlers' fishing time.

The world fish meal market became more stable in 1961, and prices edged upward. This brought the return of normal fishing effort to the industry and was responsible for a 44-million-pound increase in landings of menhaden over 1960.

An act of the New York legislature provided for the appointment of an Assistant Director of the Fish and Game Department in charge of marine fisheries, and directs that a Marine Fisheries Advisory Committee be formed. The bill is to provide the framework within which stronger State fisheries programs can be developed.

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this section: The New York Conservation Department; the Division of Fish and Game and the Division of Shell Fisheries of the New Jersey Department of Conservation and - Economic Development; and the University of Delaware Marine Research Laboratory and the Delaware Commission of Shell Fisheries.

Condensed summary data of the operating units and catch by States in the Middle Atlantic area appearing on the following pages have been previously published in Current Fishery Statistics bulletin No. 2987. Seasonal variation in the catch of fish and shellfish in the New York Marine District, and in New Jersey, can be ascertained from monthly and annual landing bulletins issued for these States in cooperation with the fishing agency of each State. Additional data on many aspects of the Middle Atlantic fisheries may be found in daily, monthly, and annual reports published by the Bureau's Fishery Market News Service, 155 John Street, New York 38, New York.

### MIDDLE ATLANTIC FISHERIES

### HUDSON RIVER SHAD FISHERY

In 1961, the spring run of shad in the Hudson River yielded a commercial catch of 178,694 fish weighing 588,989 pounds and valued at \$98,331 to the fishermen. This was a decrease of 19 percent in poundage and 9 percent in value compared with the 1960 catch. The average price per pound to the fishermen was slightly more than in the previous year.

During 1961, there were 191 fishermen employed in the Hudson River shad fishery--9 percent less than operated in 1960. Statistics on the 1961 operating units and catch of shad in the Hudson River by New York and New Jersey fishermen are included in the operating unit and catch data for these States.

### SUMMARY OF OPERATING UNITS AND CATCH, 1961

NOTE:--THESE DATA REFLECT THE CATCH OF SHAD IN THE HUDSON RIVER BETWEEN WEEHAWKEN, NEW JERSEY AND ALBANY, NEW YORK.

# SECTION 4 - CHESAPEAKE FISHERIES 177

The 1961 commercial catch of fish and shellfish landed in Maryland and Virginia totaled 478 million pounds valued at \$37 million to the fishermen. Compared with the previous year, this was an increase of 42 million pounds (10 percent) and \$2 million (6 percent). The larger catch was due primarily to improved economic conditions in the menhaden industry which resulted in greater fishing effort. Other species showing significant increases in landings were hard blue crabs, striped bass, hard clams, and shad. Major items taken in lesser volume were alewives, croakers, fluke, scup, spot, and soft clams. Virginia landings amounted to 411 million pounds (86 percent) valued at \$24 million -- 66 percent of the total for the two States.

During the year, 18,172 fishermen participated in making the catch--1,300 less than in 1960. The number of commercial fishing craft that operated in these States consisted of 1,350 vessels, 9,228 motor boats, and 1,019 other boats.

Manufactured fishery items produced in the two States were valued at \$58 million--\$3 million more than in 1960. The increase resulted from gains in the value of crab meat, menhaden products, breaded fish and shellfish, and canned fish and shellfish specialties. Shucked oysters showed the sharpest decline--down 600,000 gallons and \$3 million.

Oyster production continued at a low level, but was slightly larger than in 1960 as a result of a heavier spring yield in Virginia. The Virginia fall season was quite disappointing, particularly on public grounds, and packers looked to the Gulf States for supplemental supplies. Louisiana and Florida oysters were trucked in to help meet the demand. Maryland landings fell to a record low of 10.3 million pounds valued at \$7.8 million--a decrease of 1.4 million pounds and \$600,000 compared with 1960. The disease known as MSX was the principal cause of the relatively poor season, with a protracted spring freeze and poor oyster sets in the upper Bay during recent years also contributing factors.

The effects of the MSX disease were particularly apparent in waters of relatively high salinity; therefore, only oysters in the lower section of the Bay were affected. The seed oyster beds, which are in low salinity areas, were not harmed by the disease. However, the seed oyster fishery was adversely affected because of a poor set of spat. The demand for seed was reduced sharply as planters did not wish to put seed in areas where MSX might be present.

Under the pressure of diminishing returns, the improvement of oyster management practices received more than usual emphasis. Virginia severance taxes were increased to provide more funds for oyster bed replenishment; parasites and infectious diseases received wide and more intensive study; and for the first time in history, seed oysters were planted on public grounds. Maryland instituted a plan for dredging old shells to plant in hopes of improving spat collection. Results of actions taken by the States will not be apparent for several years.

Although the catch of nearly 75 million pounds of hard blue crabs was a record, crab meat prices were somewhat lower, which is customary in this fishery during periods of abundance. Peeler and soft blue crabs were also plentiful, though down slightly (3 percent) from 1960. A few more crab shedders started using sheltered, aerated tanks in an effort to improve production by cutting mortalities during the shedding process. The object is to maintain lower water temperatures and increase the oxygen content during the hot months when mortality is high in open floats.

Landings of soft clams were 875,000 pounds less than in 1960, due to lack of demand. New England is the principal market for these clams, and Maryland production can more than supply the limited market. Competition among producers is keen, and prices to the fishermen low, averaging \$3 per bushel. This price is much lower than in New England, perhaps because of the preference of New Englanders for home grown clams. The Maryland State legislature opened Somerset and St. Mary's Counties to soft clam dredging. Fifteen vessels began operating in St. Mary's, but no interest was shown in Somerset County. Soft clams are an unexploited resource in Virginia, and as long as Maryland continues to supply the market, little interest will be shown in Virginia for soft clams.

Hard clam production in Virginia was relatively stable but more than doubled in Maryland. This increase, amounting to 285,000 pounds, was due to the passage of a bill allowing the use of clam scrapes in Worcester County.

The once active Maryland surf clam fishery was practically nonexistent in 1961—only one vessel operated part time to obtain clams for use as codfish bait in winter and as sport fishing bait in summer. Low market prices and high operating costs, compared with the major producing areas of New Jersey, just about put an end to this fishery late in 1960.

Prices for fish meal improved in 1961, and the fishery was in considerably better economic condition than in the previous year. However, one of the five processing plants in Virginia remained closed. The total menhaden catch for reduction was 279 million pounds, an increase of 50 million pounds over 1960. Competition caused at least one producer to market a plant food prepared from fish solubles and production of other products, such as pet food and fish protein concentrate, was under consideration by industry members.

Record landings of 7,262,000 pounds of striped bass in the Chesapeake area dropped the value to \$902,000, a decline of \$89,000 below the previous year. Maryland landings of this species, which continued at a record level for the fourth consecutive year, were nearly 23 percent greater than in 1960. Biological investigations indicate that plentiful stocks of this species can be expected to continue for several years.

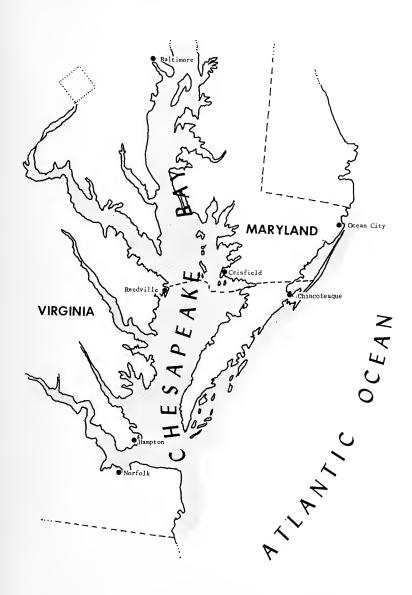

For the fourth straight year, the catch of croakers declined, and the 3 million pounds landed were the lowest reported since 1891. The decline was apparently due to high mortality of young croakers caused by unusually cold weather at the time they were in inshore waters. According to the Virginia Institute of Marine Science, there is little hope of improvement before 1963.

The longline cod fishery is relatively new to Maryland, having been started in 1959 by otter trawlers who found normal operations unprofitable. In 1961, the 24 vessels engaged in the fishery landed a record 789,000 pounds at Ocean City.

When the Federal minimum hourly wage was raised to \$1.00 for employees not formerly covered, the management of many seafood packing houses predicted disastrous consequences, which did not materialize. The cost of shucking oysters increased about 10 to 25 cents per gallon to bring some borderline shuckers up to the \$1.00-per-hour minimum. The crab meat industry was hardest hit. Picking rates were raised to help some of the slower workers make the minimum; but many could not, and exemptions were obtained for some on the basis of physical handicaps.

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this Section; Maryland Natural Resources Institute, and Maryland Department of Tidewater Fisheries; the Virginia Commission of Fisheries, and Virginia Institute of Marine Science.

Condensed summary data on the operating units and catch, by States, appearing on the following pages have been previously published in Current Fishery Statistics No. 3043. The catch of fish and shellfish in the bay and ocean areas of Maryland and Virginia is shown at the end of this section. Additional data may be found in the Maryland and Virginia monthly and annual landing bulletins published by the Branch of Statistics in cooperation with the respective States. Information on the daily, monthly, and annual production of fishery products in the more important areas of these States is available in reports published by the Bureau's Fishery Market News Service office at Hampton, Virginia.

#### VALUE OF CHESAPEAKE STATES CATCH, 1961

#### POTOMAC RIVER SHAD AND ALEWIFE FISHERY

The catch of shad in the Potomac River during 1961 totaled 41,718 fish weighing 113,100 pounds and valued at \$16,800 to the fishermen. Compared with 1960, this was a decrease of 42 percent in number, 40 percent in poundage, and 41 percent in value.

In 1961, the Potomac River catch of alewives amounted to almost 15 million fish weighing 6 million pounds and valued at \$107,003. This was a gain of 12 percent in number, 8 percent in poundage, and 23 percent in value compared with 1960.

There were 543 fishermen engaged in the Potomac River shad and alewife fisheries during 1961, compared with 538 in the previous year. Statistics on the catch and operating units of these fisheries are included in catch and operating unit data for Maryland and Virginia.

## SECTION 5 - SOUTH ATLANTIC FISHERIES

The 1961 catch of fish and shellfish landed at ports of the South Atlantic States (North Carolina, South Carolina, Georgia, and the East Coast of Florida) and the commercial catch from the inland lakes of Florida amounted to 402 million pounds valued at approximately \$20 million. Compared with the previous year, this was an increase of over 23 million pounds or 6 percent in volume, but a decline of 1 percent in value. Menhaden, fresh-water catfish and bullheads, Spanish mackerel, and sea bass were the principal species accounting for the volume increase. The lower value resulted from a sharp decline in the catch of shrimp.

The number of fishermen engaged in the commercial fisheries of the South Atlantic area totaled 12,694--a decrease of 234 compared with 1960. Vessels of 5 net tons and over operating in the fishery totaled 1,185--an increase of 11 over the previous year.

There were 458 fishery wholesaling and processing establishments operated compared with 454 the previous year. These firms employed over 7,000 people and manufactured fishery products valued at \$44 million--an increase of about \$3 million compared with 1960. Most of the increase was accounted for by the higher value of packaged breaded products, principally shrimp, the main species processed in the area.

North Carolina continued its role as the leading producer volume-wise, accounting for 71 percent of landings. The East Coast of Florida, which accounted for only 19 percent of the volume, led the South Atlantic States in the value of the catch. In only these States were landings greater than in 1960--an increase of 22 million pounds in North Carolina, and 14 million pounds in the East Coast of Florida.

Menhadenlandings of nearly 255 million pounds were 39 million pounds more than in 1960. These increases were reflected in each of the producing States: North Carolina registered a gain of 31 million pounds; and East Coast of Florida, 8 million pounds. It is probable that North Carolina landings would have been greater had not bad weather curtailed fishing operations during the latter part of December. Market prices for menhaden meal remained almost steady throughout the year, with an average price of \$115 per ton-\$33 greater than in 1960. As the season advanced, oil prices exhibited a downward trend. This was primarily a result of greater competition from South American producers vying with United States firms for the European market, which has been the principal outlet for many years.

Landings of shellfish decreased by 15.6 million pounds, or 19 percent, from those of 1960. Of the three major fisheries affected, shrimp was the hardest hit, with a decrease of 11.5 million pounds, and crab landings decreased 4.4 million. The production of oyster meats was 135,000 pounds less than in 1960. Due to slightly increased prices paid for shrimp and oysters, the value of shellfish landings declined only \$1.9 million or 15 percent compared with 1960.

The shrimp fishery, which is the economic mainstay of the commercial fisheries of the South Atlantic States, experienced its poorest year, volume-wise, since 1918. The 19.7 million pounds landed were 11.5 million pounds (37 percent) less than in 1960. Although the decline was apparent in all States, South Carolina was hardest hit with a drop of 51 percent, followed by North Carolina, 50 percent; Georgia, 35 percent; and the East Coast of Florida, 11 percent. The slightly greater proportion of large-size shrimp landed, coupled with higher ex-vessel prices, resulted in an average price increase of about 8 cents per pound over that recorded in 1960. This increase compensated, in only a very small measure, for the greatly reduced catches.

In South Carolina, there was some forewarning that commercial shrimp catches for the year would be below normal. The staff of the Bears Bluff Laboratories, Wadmalaw Island, South Carolina, announced in March a significant decrease in numbers of postlarval brown shrimp collected in connection with plankton studies and anticipated that this would be reflected in commercial catches later in the year. They attributed this decline primarily to the extremely cold weather of the previous winter.

Landings of blue crabs were 4.4 million pounds less than in 1960 due to reduced landings in Georgia and South Carolina. The 16 million pounds of blue crabs landed in North Carolina surpassed, by 1 million pounds, the previous record established in 1960. Blue crab landings on the East Coast of Florida were up 500,000 pounds over the previous year. The minimum wage law, which became effective during September, made crab processors apprehensive about their ability to pay the new hourly rate and still maintain a reasonable price for their product. The application of the minimum wage law to this aspect of seafood processing led the Bureau of Commercial Fisheries to sponsor a study to develop automatic equipment. It was felt that automating as much of the processing as possible would enable processors to comply with the minimum wage law without an increase in cost of crab meat to customers. Blue crabs were plentiful in all areas, and it is probable that landings would have been much greater if there had been a strong demand.

Landings of nearly 4 million pounds of oyster meats were 3 percent less than in 1960. The catch was down in all States except the East Coast of Florida, where the production increased to 72,000 pounds of oyster meats—up 28,000 pounds from the 44,000 pounds produced in 1960. Due to a strong market, the value of the total production increased 15 percent over that of the previous year. The oyster shortage in the Middle Atlantic and Chesapeake States continued, thus assuring ready outlets for all South Atlantic production. To meet market demands, some Gulf of Mexico oysters were shipped to the South Atlantic States. State conservation officials were diligent in their attempt to develop sound management principles essential to a sustained maximum harvest. Oyster shucking plants were hard pressed to comply with the new minimum wage law and retain prices at a level acceptable to the consumer.

The poor shrimp season prompted some fishermen to seek other means of supplementing their incomes. This led to the development of a rather intensive fishery for sea bass utilizing traps or pots. Approximately 36 vessels operating out of North and South Carolina ports were engaged in this fishery. Most of the fishing was conducted in the offshore waters at depths of 10 to 16 fathoms. The pots or traps used were identical to, and in some instances, were the same ones used in the crab fishery. The number of pots fished per vessel varied from 10 to 24. This fishery accounted for the bulk of the 983,000 pounds of sea bass landed during the year--the highest total for this species in many years. As another means of supplementing incomes, fishermen expended greater effort in the trawl fishery for finfish.

While mullet landings decreased 1 million pounds in North Carolina, heavier landings at South Carolina and East Coast of Florida ports compensated for this decline. As a result, total landings for the South Atlantic area were only 87,000 pounds less than those recorded for 1960. Average prices per pound paid at dockside were about the same as for 1960 in North Carolina and Florida, East Coast. In South Carolina, the average of 9 cents per pound was an increase of 3 cents over that paid in 1960.

The use of aircraft for locating fish schools was expanded in the fisheries of Florida during 1961. In addition to their utilization in spotting menhaden and Spanish mackerel, aircraft were successfully used in spotting pompano and, in some instances, mullet.

The exploratory vessel <u>Silver Bay</u>, chartered by the <u>Bureau</u>, continued surveys to determine the fishery potential of the <u>South Atlantic</u> area. In addition to further delineations of concentrations of calico scallop off the <u>Plorida</u> and <u>North Carolina Coasts</u>, a potential was found for a trawl fishery for snappers off the northeast coast of <u>Plorida</u> and <u>Georgia</u>. There was little commercial exploitation of the calico scallop beds discovered the previous year by the <u>Silver Bay</u>. It appears that the principal factor barring exploitation has been the inability to construct a shucking device which would operate satisfactorily aboard a vessel at sea.

Biological research of the Bureau of Commercial Fisheries Laboratories at Beaufort, North Carolina and Brunswick, Georgia, relating to the important species of the South Atlantic area were continued. Duke University was awarded two grants by the National Science Foundation. The first, \$40,000, was for basic research on shrimp, crabs, barnacles, and other crustacea with particular emphasis on larval development under controlled laboratory conditions. The second grant, \$618,676, was for the construction of a biological oceanographic research vessel and suitable berthing facilities at their Marine Laboratory, located at Pivers Island, Beaufort, North Carolina.

The annual meeting of the Southeastern Fisheries Association was held at Jacksonville, Florida, in May 1961. Principal item of discussion was the need for an all-out effort on the part of members to insure passage of a Seafood Commission bill for the State of Florida that would provide a setup similar to the Florida Citrus Commission which has been successful in solving problems of that industry. Other items of discussion related to estuarine problems and the development of fishery resource potentials. The association voted to endorse the resolution of the Gulf States Marine Fisheries Commission seeking additional Federal funds for shrimp research in the Gulf area.

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this section: The North Carolina Department of Conservation and Development, Division of Commercial Fisheries; South Carolina Wildlife Resources Department, Division of Commercial Fisheries; Georgia Game and Fish Commission, Coastal Fisheries Division; and Florida State Board of Conservation and Marine Laboratory, University of Miami.

Condensed summary data on the operating units and catch of the South Atlantic Section appearing on the following pages have been previously published in Current Fishery Statistics No. 3021. Seasonal variation in the catch of fish and shellfish in North Carolina, South Carolina, Georgia, and Florida can be ascertained from the 1961 monthly and annual landing bulletins issued for each of these four States in cooperation with the fishery agency in each State. Additional data on many aspects of the South Atlantic fisheries may be found in the daily, monthly, and annual reports published by the Hampton, Virginia, Market News Office of the Bureau.
