# FISHERY STATISTICS OF THE UNITED STATES 1961

BY E. A. POWER

PUBLISHED BY BUREAU OF COMMERCIAL FISHERIES • WASHINGTON • 1963
PRINTED AT U.S. GOVERNMENT PRINTING OFFICE, WASHINGTON

Fishery statistics of the United States are compiled and published annually to make available information on both the economic and biological aspects of the domestic commercial fisheries.

Data on the economic aspects are necessary to persons engaged in the commercial fishery and to governmental agencies concerned with its regulation and protection. Those here given cover the total catch and value by species, the yield and value of manufactured products, the employment of men, craft, and gear in the capture of fishery products; and related information.

From the biological standpoint these data are important to sound fishery management in providing detailed information on fluctuations in the commercial catch by species, locality, and gear, and type of craft operated. They assist conservation agencies in regulating the commercial fisheries so as to produce maximum yields without depletion.

Previous statistical reports on the fishery industries were issued under the Department of the Interior in the Administrative Report series for 1938 and in the Statistical Digest series for succeeding years. Reports for preceding years were issued in the Administrative Report series of the former Bureau of Fisheries.

The following is a listing of the various editions of "Fishery Statistics of the United States" issued since 1939:

Title

Statistical Digest

#### **ACKNOWLEDGEMENTS**

The data in this edition of "Fishery Statistics of the United States" were collected, tabulated, and prepared for publication by the staff of the Branch of Statistics under the direction of E.A. Power and Charles H. Lyles, assisted by Stacey C. Denham and Francis Riley. Field surveys were supervised by the various regional and area offices. Project leaders in charge of field surveys were: Dwight L. Hoy, New England, Middle Atlantic, and Chesapeake States; George W. Snow, South Atlantic and Gulf States; Victor J. Samson, California; Charles M. Reardon, Washington and Oregon; William K. Evans, Alaska; Howard J. Buettner, the Great Lakes and Mississippi River States; and Thomas S. Hida, Hawaii.

The cooperation of the many contributors is gratefully acknowledged. Cooperators are given credit for their information in the section of the report in which the data appear.

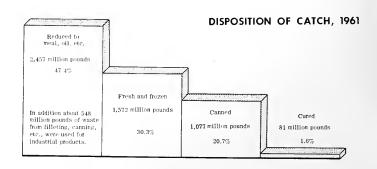

#### **PREFACE**

This report contains a review of the fishery statistics for the year 1961 collected by the Branch of Statistics, Division of Resource Development. These statistics include data on the volume and value of the catch of fishery products, employment in the fisheries, quantity of gear operated, number of fishing craft employed in the capture of fishery products, information on the volume and value of the production of manufactured fishery products, data on cold storage freezings and holdings, and on foreign trade in fishery commodities.

In assembling the data on the fisheries, all appropriate records collected by the various State fishery agencies were used. In certain areas, information complete enough to be used by the statistical agents was available from State agencies, and in these States, only partial surveys were conducted. Information on the means of collecting the data and an explanation of terms used may be found in Section 13 of this publication. Statistics on the imports and exports of fishery products were furnished by the Bureau of the Census.

Complete statistical surveys covering the fisheries of the United States were conducted in all areas for 1961, except for the Mississippi RiverStates, where only a partial survey was made. The first complete survey of the fisheries of the United States was made by the Bureau of the Census for 1908. Others were made by the Bureau of Fisheries and the Fish and Wildlife Service for the years 1931, 1950, and for the years 1954 to 1960, inclusive.

To assist persons interested in reviewing historical statistics of the domestic fisheries, a bibliography was published in the 1956 edition of "Fishery Statistics of the United States," listing the sources of data on the fisheries of the various regions of the United States for the years from 1880 to 1956.

#### SECTION 1 - GENERAL REVIEW

The 1961 commercial fisheries of the United States yielded a catch of 5.2 billion pounds valued at \$362 million to the fishermen. The annual harvest was greater only in 1956, when a record 5.3 billion pounds were taken. Landings in 1961 were 244 million pounds larger than in 1960. The total amount paid fishermen in 1961 (\$362 million) was nearly \$9 million more than in the previous year, but \$11 million less than the record \$373 million paid in 1958. The average price per pound was 6.98¢, the lowest since World War II, except for 1959. The large catch of low-priced menhaden was responsible for the low price per pound. Record catches of menhaden, king crabs, clams, catfish and bullheads, and sea scallops; and substantial gains in landings of Pacific salmon, tuna, mackerel (jack and Pacific), and haddock accounted for the 1961 gain in volume. There were, however, sharp declines in the landings of shrimp, Atlantic and Pacific sea herring, and Pacific sardines.

The 1961 catch was taken by 129,693 fishermen. Of these 41,055 were employed on vessels. A total of 11,964 vessels of 5 tons and over, 60,118 motor boats, and 5,405 other craft engaged in commercial fishing during the year. The 4,138 fish wholesaling and manufacturing plants in the United States employed 92,115 persons. Fishermen engaged in processing their catches into manufactured products numbered 820.

The record 2.3 billion pounds of menhaden taken in 1961 were the largest annual landings of a single item in the history of the United States fisheries. Menhaden has ranked first in volume continuously since 1946. The 1961 receipts were 296 million pounds above those of the previous year and exceeded the 1959 record by 112 million pounds. Menhaden accounted for 45 percent of the domestic catch in 1961. Production from waters north of Cape Cod was poor in 1961, but catches increased in all other areas. In the Gulf of Mexico, fishing was most encouraging, and for the first time landings exceeded 1 billion pounds.

In the spring of 1961, concern was expressed over the decline in the price of fish meal. An international meeting was held in Rome, to assess the world demand for fish meal and to explore possibilities of insuring stable international markets for this product. By the end of 1961, meal was in light supply, although United States production and imports were the largest in history. Prices had shown a marked recovery, and dealers were actively seeking new sources of meal.

The 1961 Pacific salmon catch was  $310\,\mathrm{million}$  pounds valued at a near-record \$52 million. Although the volume taken was 75 million pounds larger than in 1960, it was still far less than the record 791 million pounds landed in 1936. The 1961 pack of canned salmon (3.7 million cases valued at \$117 million) exceeded the 1960 pack by 30 percent in volume and 33 percent in value.

The catch of salmon was favorable in nearly all sections of the Pacific Coast, although most of the increase occurred in Alaska. Alaska landings (265 million pounds) were the largest since 1956, and their value (\$36 million) was a record. The catch of red salmon in Western Alaska was the best since 1948, and the pink salmon catch in the northern waters of Southeastern Alaska was the largest since 1951. In Central Alaska, salmon fishing along the Alaska Peninsula and Kodiak Island was about the same as in the previous year; however, Prince William Sound had an excellent, but unexpected, run of pink salmon. In Washington, due principally to largerruns of silver and pink salmon, the catch exceeded the previous year by 81 percent. Oregon and California landings were also considerably above the 1960 level.

The Pacific tuna industry, stimulated by the success of converted seiners and the rapidly increasing consumption of canned tuna, displayed spectacular economic progress in 1961. Domestic landings by the Pacific tuna fleet increased from 288 million pounds in 1960 to 311 milion pounds in 1961. Catches of yellowfin, skipjack, and bluefin were larger, although the volume of albacore landed was somewhat less than in the previous year. About 88 percent of the catch of tuna was taken on the high seas in waters off Central and South America.

The California tuna fleet (changed by conversion from a predominantly clipper fleet, fishing with hook and line, to a purse seine fleet fishing with hugh nets) took large quantities of yellowfin in 1961. There were indications, however, that this species was being overfished, and considerable effort was devoted to taking skipjack. In 1961, the Inter-Anerican Tropical Tuna Commission recommended that a catch limit be placed on yellowfin tuna in order to maintain stocks at a level that would permit the maximum sustainable yield.

The catch of tuna by purse seines was a record 234.3 million pounds—60.2 million pounds more than in 1960. Lines of all types accounted for only 89.1 million pounds—33.5 million pounds less than in 1960, and 246.5 million pounds under the record 335.6 million pounds taken by this gear in 1950.

Producers of canned tuna turned out the largest pack (15.8 million cases) in history, valued at a new high of \$189 million. Compared with 1960, this was an increase of 462,000 cases and \$16 million. Of the total United States pack, 56 percent was canned from the domestic catch--5 percent more than in 1960. The pack in the Pacific Coast States, (11.8 million standard cases valued at \$141.1 million) represented 75 percent of the volume and 75 percent of the value of the total domestic pack of these fish.

The United States catch of shrimp amounted to 175 million pounds, with an ex-vessel value of nearly \$52 million. Compared with 1960, the volume landed was down 75 million pounds or 30 percent; the value, \$15 million or 23 percent. The catch was 94 million pounds less than the record 268 million pounds landed in 1954.

The catch of shrimp in the South Atlantic States was the poorest, for any year in which data have been collected, since 1918. The situation was also discouraging in the Gulf of Mexico, where landings decreased drastically in all States. On the Pacific Coast, catches were larger in Alaska, but the combined catch in the other West Coast States was almost identical with the previous year.

Production of packaged, raw, and headless shrimp in 1961 was 32.4 million pounds below that of 1960; however, peeled and deveined and breaded shrimp was up 7 percent. The increase in the latter category resulted from record imports of 126 million pounds, which partially compensated for the poor production from waters off the South Atlantic States and in the Gulf of Mexico.

The 1961 catch of sea herring (only 113 million pounds) was less than half the 239 million pounds taken in 1960. On the Atlantic Coast, Maine landings of herring (used principally for canning sardines) were only 54 million pounds—a decrease of 98 million pounds from the previous year. Imports of herring into Maine from Canada also declined. There was no clear-cut explanation for the shortage of fish in inshore waters, as there were indications of a supply offshore, throughout the season. In an effort to help the industry, a temporary measure was passed by the Maine State Legislature ending all seasons and placing the fishery on a year-round basis until January 1963. However, the pack of 754,000 cases was the smallest in 23 years. Imports of canned sardines in oil were up 31 percent and the nonoil pack was up 138 percent. Although imports alleviated the shortage resulting from the poor domestic season, they also caused concern over the possible loss of markets to foreign packers.

Pacific Coast landings of sea herring, taken mostly in Alaska for manufacture into meal and oil, were only 54 million pounds. The catch was the lowest since 1954, and one of the half-dozen smallest since the early 1920's, when there was a large expansion in the Alaska herring reduction industry.

New England groundfish landings (cod, cusk, haddock, hake, pollock, and ocean perch) were 336 million pounds—about 3 percent above those of the previous year. Despite the small overall increase in catch, the North Atlantic groundfish industry continued in the depressed condition that has prevailed for the past decade. Haddock landings (133.5 million pounds) were 15 million pounds larger than in 1960, and cod (42 million pounds) was up 7 million pounds. The catch of ocean perch, however, fell to 132 million pounds from 141 million pounds in 1960. Imports continued to provide an ever-increasing percentage of the United States supply of groundfish fillets, accounting for 68 percent of the total 1961 supply of 288 million pounds. In 1951, only 37 percent of the supply of groundfish came from imports; and in 1939, only 9 percent.

The 1961 halibut fishery of the United States and Canada in the Northeastern Pacific Ocean and Bering Sea caught 69.5 million pounds (landed weight). The catch was about 2.4 million pounds less than the record 71.9 million pounds taken in 1960. Contributing to the decline was the elimination of the second fishing season in Area 2. The short postseason in this area usually yields about half the amount of the 1961 decline. United States fishermen landed 40 million pounds (58 percent) of the 1961 total. Canadian fishermen took less fish than in the previous year (42 percent), thus reversing a trend of the past few years when Canadian fishermen had been increasing their percentage. Halibut fishing continued throughout the season without interruption from labor or price difficulties. Ex-vessel prices were good.

The fishery for Pacific and jack mackerel was better in 1961 than in the previous year. The catch of jack mackerel increased from 75 million pounds in 1960 to 98 million pounds, or 30 percent. Pacific mackerel landings were up from 37 million pounds to 44 million pounds, for a 20-percent increase. Mackerel was relatively plentiful throughout 1961, although fishermen found them in waters well offshore, rather than in the customary inshore areas. Canners found it necessary to set trip quotas for the seiners during virtually the entire season.

The 1961 Pacific sardine season was one of the poorest on record. The catch (only 43 million pounds) was 14 million pounds, or 25 percent, less than in 1960, and only 3 percent of the record 1.5 billion pounds taken in 1936. The 1961 pack of Pacific sardines (419,000 cases valued at \$3.7 million) was the fourth smallest since World War I. Canners were anxious for fish, and prices were stable; but large quantities of sardines failed to appear off Southern California. Fishermen reported the fish to be wild, making it impossible at times to make large catches on single sets.

The 1961 catch of crabs was a record 232 million pounds valued at \$17 million. Compared with 1960, this was an increase of 10 million pounds (4 percent) in volume and \$269,000 (2 percent) in value. The gain was largely in Alaska, where the spectacular king crab industry increased its catch from 28.6 million pounds in 1960 to 43.4 million pounds in 1961. Landings of blue crabs in the Chesapeake area established a new record, and catches in the Gulf were the heaviest since 1945; however, a decline in the South Atlantic catch resulted in an overall decrease in blue crab landings. On the Pacific Coast, Dungeness crab catches were less than in the previous year.

The 1961 production of oysters, although 2.3 pounds above the landings in 1960, was one of the smallest in over one hundred years. The catch of 62 million pounds, valued at \$33 million, was only 40 percent of the 1908 landings of 152 million pounds. Production was down in the New England, South Atlantic, and Pacific Coast States, but was up in other areas. A heartening development was the increased harvest in New Jersey, where the fishery had nearly been wiped out by disease.

A total of 343 whales (72 more than in 1960) was taken by six catcher vessels operated by two whaling stations located in San Francisco Bay and a third company located at the mouth of the Columbia River. The season was the most successful since whaling resumed on the Pacific Coast of the United States in 1956. The catch was processed into nearly 12 million pounds of whale products, valued at \$847,000.

A total of 95,974 sealskins was harvested on the Pribilof Islands in 1961—the third largest production in this century. Only in 1943, (117,184 skins) and 1956, (122,826 skins) was the yield greater.

#### UNITED STATES CATCH, 1946-61

| Year | Quantity | Value to<br>fishermen | Average price<br>per pound |
|------|----------|-----------------------|----------------------------|
|      | Million  | Million               | por pourie                 |
|      | pounds   | dollars               | Cents                      |
| 1946 | 4,467    | 313                   | 7.01                       |
| 1947 | 4,349    | 312                   | 7.16                       |
| 1948 | 4,513    | 371                   | 8.22                       |
| 1949 | 4,804    | 343                   | 7.13                       |
| 1950 | 4,901    | 347                   | 7.09                       |
| 1951 | 4,433    | 365                   | 8.23                       |
| 1952 | 4,432    | 364                   | 8.20                       |
| 1953 | 4,487    | 356                   | 7.94                       |
| 1954 | 4,762    | 359                   | 7.55                       |
| 1955 | 4,809    | 339                   | 7.05                       |
| 1956 | 5,268    | 372                   | 7.06                       |
| 1957 | 4,789    | 354                   | 7.39                       |
| 1958 | 4,747    | 373                   | 7.86                       |
| 1959 | 5,122    | 346                   | 6.76                       |
| 1960 | 4,942    | 354                   | 7.15                       |
| 1961 | 5,187    | 362                   | 6.98                       |

San Pedro, California, was the leading United States fishing port in 1961, in both volume and value. Landings there were 420 million pounds, having an ex-vessel value of \$36 million. Pascagoula, Mississippi, was second with 384 million pounds; followed by Lewes, Delaware, 303 million pounds; Reedville, Virginia, 272 million pounds; Cameron, Louisiana, 252 million pounds; and Empire, Louisiana, 247 million pounds. Of these, all but San Pedro were entirely, or principally, menhaden ports. New Bedford, Massachusetts, was second in value of landings with \$15 million; followed by Boston, Massachusetts, \$10 million; San Diego, California, \$8 million; and Gloucester, Massachusetts, \$6 million.

In 1961, as in 1959, the catch taken for industrial products (2.7 billion pounds) exceeded the quantity for human food (2.5 billion pounds). Industrial products included the amount manufactured into meal, solubles, and oil; used for bait; fed to fur-bearing animals and pets; and manufactured into shell buttons, etc. It was estimated that the 1961 catch was marketed as follows: 1,572 million pounds (round weight) as fresh and frozen, 1,077 million pounds for canning, 81 million pounds for cured products, and 2,457 million pounds for manufacture into industrial products. About 548 million pounds of waste for filleting, canning, and otherwise preparing fish for market were also used in the manufacture of industrial products.

The per capita consumption of fish and shellfish in the United States in 1961 amounted to 10.7 pounds (edible weight)--0.4 pound more than in 1960. Of this amount, fresh and frozen items accounted for 5.9 pounds; canned, 4.3 pounds; and cured, 0.5 pound. There has been little change in the per capita consumption of fish and shellfish during the past 30 years, except from 1931 to 1934, and 1942 to 1944, when consumption declined due to the depression of the 1930's and World War II. However, while total consumption has remained steady, there has been a sharp decline in consumption of domestic products and a corresponding gain in imports. Available data indicated that in 1948, over 80 percent of the items consumed were of domestic origin, compared with less than 60 percent in 1961.

8

The total pack of canned fishery products by 366 plants in the United States, American Samoa, and Puerto Rico, amounted to 33 million standard cases (1 billion pounds) valued at \$423 million to the packers. Compared with 1960, production was down 1.5 million cases (46 million pounds). The value, however, was \$35 million above that of the previous year. Increased production of high-valued salmon, tuna, mackerel, crab meat, and clam products was responsible for the gain. The pack for human consumption was 42 million pounds above that of 1960 due to larger packs of salmon, tuna, and mackerel. Canned bait and animal food was less than in 1960, because animal food containing less than 10 pounds of fish per standard case of 48 pounds was excluded in 1961. (The pack containing less than 10 pounds per case amounted to 2.4 million standard cases). The value of two items—canned salmon and tuna—accounted for 72 percent of the total revenue received by producers of canned fishery products in 1961.

The 1961 production of industrial fishery products by 170 plants in the United States, American Samoa, and Puerto Rico, in 1961, was valued at \$74.6 million. Compared with 1960, this was an increase of \$8 million. Production of marine animal scrap and meal increased from 290,000 tons in 1960 to 311,000 tons in 1961, establishing a new record. Menhaden meal represented 80 percent of the total. Over 34 million gallons of marine-animal oils were produced in 1961. Compared with 1960, this was an increase of 6.5 million gallons, and the largest production since 1939, when the California sardine fishery was at its peak. Menhaden oil (31.4 million gallons) accounted for 91 percent of the total. Fish solubles and homogenized condensed fish increased from 99,000 tons in 1960, to 112,000 tons in 1961. However, it was well below the 165,000 tons manufactured in 1959. Some firms added solubles to their meal, which resulted in the production being reported as meal, rather than solubles. Products from oyster shells and buttons from fresh-water and marine mollusk shells were valued at \$9.4 million in 1961. Other industrial products (agar-agar, fish feed pellets and animal feeds, Irish moss extract, kelp products, liquid fertilizer, mollusk shell lime, pearl essence, and crab shells) manufactured in 1961 were valued at \$13.4 million.

The production of fresh and frozen packaged fish fillets and steaks in the United States during 1961 totaled 158.1 million pounds valued at \$51.8 million to the processors. This was an increase of 4.9 million pounds (3 percent) and \$3.3 million (7 percent) compared with 1960. It was estimated that 448.6 million pounds of round whole fish were required for the 1961 production of packaged fillets and steaks. Haddock fillets (38.2 million pounds) and Atlantic ocean perch fillets (37.5 million pounds) were the leading items in 1961, accounting for 48 percent of the total volume and 41.5 percent of the total value. Other leading items filleted and steaked were flounders, cod, halibut, and pollock, which made up 37 percent of the total quantity and 42 percent of the total value. The greatest production of packaged fish occurred in the New England area, which accounted for 70 percent of the volume and 61 percent of the total value.

The 1961 production of frozen fish and shellfish by firms reporting to the Bureau of Commercial Fisheries totaled 319.6 million pounds. Leading products frozen during the year were shrimp, (74 million pounds); bait and animal food, (67.6 million pounds); blocks, fillets, and steaks, consisting largely of ocean perch and haddock (56 million pounds); halibut (32.7 million pounds); and headed and gutted whiting (29 million pounds). These items accounted for 81 percent of the total freezings of fish and shellfish. It was estimated that approximately 509 million pounds of fish and shellfish were needed to produce the 319.6 million pounds of round, dressed, and drawn fish, fish fillets, and packaged shellfish frozen in 1960.

United States foreign trade in fishery products (imports plus exports of domestic products) was valued at \$432 million in 1961—an increase of \$27.5 million over the previous year. The value of fishery products imported for consumption was \$397 million—the highest on record. It exceeded by 8 percent the former record established in 1959 and was 10 percent above that of 1960. The value of fishery products exported was \$35 million—a decline of 21 percent from the previous year. Imports of edible products in 1961 totaled 1.1 billion pounds valued at a record high of nearly \$336 million. Compared with 1960, the volume remained about the same, but the value increased 9 percent. This gain was due to generally higher prices and changes in composition of the receipts. Major increases occurred in imports of frozen groundfish fillets and blocks, fresh and frozen shrimp, canned tuna, and canned sardines. Items imported in reduced volume

included canned salmon, fresh or frozen sea herring, and tuna. Imports of nonedible fishery products were valued at \$61 million--16 percent more than in 1960. Gains in receipts of fish meal, sperm whale oil, and cultured pearls accounted for the increase. Edible fishery products exported in 1961 totaled 40 million pounds with a value of \$19.6 million--a decrease of 35 percent in quantity and 24 percent in value compared with the previous year. Exports of nonedible domestic products, valued at \$15 million, were 18 percent less than in 1960.

The 1961 world commercial catch of fish, crustaceans, mollusks, etc., totaled a record \$90.7 billion pounds. The catch was 8 percent greater than the 1960 production of 83.8 billion pounds and more than double the volume taken in 1938 and 1948-just before and after World War II. In 1956, the United States followed first-place Japan as a fishing nation. In 1961, it was fifth, preceded by Japan, Peru, China (Mainland), and the U.S.S.R.

There were 430 vessels documented as fishing craft in 1961, including some that were previously removed from the record, but redocumented again during 1961.

#### VESSELS OBTAINING DOCUMENTS AS FISHING CRAFT, 1950-61

| Year | First Documentation | Redocumentation | Total |
|------|---------------------|-----------------|-------|
| 1950 | 812                 | 29              | 841   |
| 1951 | 780                 | 28              | 808   |
| 1952 | 675                 | 24              | 699   |
| 1953 | 729                 | 25              | 754   |
| 1954 | 717                 | 28              | 745   |
| 1955 | 418                 | 23              | 441   |
| 1956 | 521                 | 17              | 538   |
| 1957 | 601                 | 18              | 619   |
| 1958 | 684                 | 29              | 713   |
| 1959 | 479                 | 34              | 513   |
| 1960 | 408                 | 24              | 432   |
| 1961 | 410                 | 20              | 430   |

In connection with compiling statistics on the fisheries for 1961, information on the age of the United States fishing fleet was assembled for the first time. The data revealed that the Chesapeake sail dredge vessels are the oldest fishing fleet in the United States, while the menhaden and shrimp fleets of the Gulf of Mexico were the newest. The figures showed that few New England otter trawl vessels had been built in recent years. The oldest of the large trawlers operating in 1961 was constructed in 1928, while the average for the entire fleet was 1940. The average medium trawler fishing North Atlantic waters was built in 1941. Small trawlers were even older--the average vessel having been built in 1938.

Forty-five percent of the total United States catch in 1961 was made by 180 menhaden vessels operating off the Atlantic and Gulf Coasts. While the menhaden fleet operating in the Gulf of Mexico is of more recent construction (the average vessel having been built in 1951), the average menhaden seiner operating in the Chesapeake Bay was built in 1915.

Detailed summaries of the catch and operating unit data for the United States have been previously published in Current Fishery Statistics No. 3142.

Summaries of operating unit and catch statistics for each region of the United States (except Mississippi River Fisheries) have been published in the Current Fishery Statistics series of bulletins. "Fisheries of the United States," a preliminary review, is available in April of each year. It contains current information on many aspects of the fisheries such as domestic and world catch, per capita consumption, price indexes, foreign trade, supplies, etc; and comparative data for previous years. This publication may be obtained free from the Office of Information, United States Fish and Wildlife Service, Washington 25, D.C.

The current statistical publications of the Bureau that contain data on the domestic fisheries are listed in Fishery Leaflet 432 "Fishery Statistical Publications of the Bureau of Commercial Fisheries." The publication also lists other Federal agencies, interstate commissions, and international and nongovernmental sources of fishery statistics. Copies of this leaflet may be obtained free from the Office of Information.

<sup>1/</sup> UNCLASSIFIED SPECIES FOR BAIT, REDUCTION, AND ANIMAL FOOD.

<sup>2/</sup> FIRST YEAR IN WHICH AN OYSTER SURVEY WAS MADE IN ALL REGIONS.

<sup>3/</sup> SINCE DATA ARE NOT AVAILABLE ON THE POUNDAGE OF WHALES TAKEN, STATISTICS ON THE YIELD OF THESE MAMMALS REPRESENT THE WEIGHT OF THE WHALE PRODUCTS PRODUCED WHICH INCLUDE MEAL, MEAT, AND OIL.

<sup>4/</sup> DATA NOT AVAILABLE.

#### RELATIVE VALUE OF THE CATCH, BY SPECIES, 1961

#### UNITED STATES CATCH, 1961 - LIVE WEIGHT BASIS

In the annual digest it has been the practice of the Bureau to show the catch of univalve and bivalve mollusks on the basis of the weight of meats. Insofar as possible, all other fish and shellfish items are shown on a live weight basis.

Since world fishery statistics published by the Food and Agriculture Organization of the United Nations represent the live weight of the catch for all items of fish and shellfish, it has been necessary to provide that organization with information on the domestic catch of all species on a live weight basis. Data released by the Food and Agriculture Organization, therefore, indicate that the 1961 United States catch was 1.3 billion pounds greater than the figure appearing in Bureau publications. The increase is due to the inclusion of the weight of the shells of univalve and bivalve mollusks in the Food and Agriculture Organization data.

It has been deemed desirable to include in this report a table showing the entire domestic catch on a live weight basis. Information is also published on the catch of fishery products in the principal countries of the world so that the relative importance of the domestic fisheries can be determined. Tables containing these data follow:

## WORLD CATCH OF FISH, CRUSTACEANS, MOLLUSKS, ETC., BY COUNTRIES

The 1961 world commercial catch of fish, crustaceans, mollusks, etc., totaled a record 90.7 billion pounds, according to the "Yearbook of Fishery Statistics, 1961" released by the Food and Agriculture Organization of the United Nations. The 1961 catch was 8 percent over the 1960 production of 83.8 billion pounds and was more than double the volume taken in 1938 and 1948—just before and after World War II.

Five countries accounted for well over 50 percent of the 1961 world catch. Japan (16.3 percent) continued to be the leading fishing nation of the world. Peru, the third place fishing nation in 1960, moved up to second position in 1961 with 12.7 percent of the world catch. In third place was China (Mainland) with 12.2 percent, followed by the U.S.S.R.(7.9 percent), and the United States (7.1 percent).

In 1956, the United States ranked second only to Japan as a fishing nation. In 1961, it followed not only Japan but also Peru, China (Mainland), and the U.S.S.R. Peru's catch has risen phenomenally from only 470 million pounds in 1955 to 11.6 billion pounds in 1961, due chiefly to the development of the anchovy fishery.

Asia, excluding the U.S.S.R., accounted for 41 percent of the world catch. Europe, excluding the U.S.S.R., accounted for 20 percent, followed by South America, 15 percent; North America, 10 percent; U.S.S.R., 8 percent; and Africa, 6 percent. An insignificant percentage was taken in Oceania.

About 37 percent of the world catch was marketed fresh. Reduction into meal and oil accounted for 23 percent; cured, 18 percent; and canned and frozen, 10 percent each. The remaining 2 percent was used for miscellaneous purposes.

#### MANUFACTURED FISHERY PRODUCTS

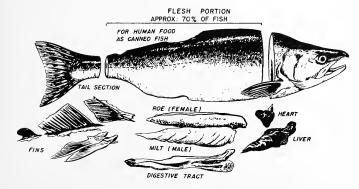

The 1961 production of manufactured fishery products (packaged fresh and frozen, canned, cured, and industrial products) in the United States, American Samoa, and Puerto Rico was valued at \$877 million to the packers. This was \$63 million more than in the previous year. Canned products made up 48 percent of the total value; fresh and frozen packaged items, 37 percent; industrial products (principally meal, oil, and solubles), 9 percent; and cured products, 6 percent.

The canned fish and shellfish pack in 1961 totaled 1 billion pounds valued at \$423 million. The pack for human food amounted to 709 million pounds valued at \$383 million, while that for animal food and bait totaled 334 million pounds valued at \$40 million. Tuna led all other species in 1961 with a record pack of 15.8 million standard cases (311 million pounds), valued at \$189 million—\$16 million more than in 1960.

The pack of canned salmon amounted to 3.7 million cases (177 million pounds) valued at \$117 million. This was an increase of 862,000 cases and \$29 million over the 1960 total. Canning of Maine sardines was far below normal. Only 754,000 cases (17.6 million pounds) valued at \$7.6 million were packed--1.2 million cases and \$9.1 less than in 1960. The decline was caused by failure of the fish to appear in usual numbers rather than market conditions.

Production of fresh and frozen packaged fish and shellfish in 1961 amounted to 583 million pounds valued at \$327 million, a decline of 2 million pounds but an increase of \$10 million. Higher prices for processed shrimp and oysters accounted for most of the gain. Industrial fishery products, principally fish meal, oil, and solubles, were valued at nearly \$75 million—an increase of \$8 million over the previous year. Fish meal production totaled a record 311,000 tons valued at \$32 million, an increase of 21,000 tons and \$7 million compared with 1960. Over 34 million gallons of marine animal oil valued at \$14 million were produced—7 million gallons and nearly \$1 million more than in the previous year. Production of fish solubles and homogenized condensed fish amounted to 112,000 tons valued at \$5 million—an increase of 13,000 tons and \$1.4 million.

# CANNED FISHERY PRODUCTS

The 1961 pack of canned fishery products by 366 plants in the United States, American Samoa, and Puerto Rico amounted to 33 million standard cases (1 billion pounds) valued at \$423 million to the packers. Compared with 1960, production was down 1.5 million cases (46 million pounds). However, the value was \$35 million above that of the previous year. Increased production of high-value salmon, tuna, mackerel, crab meat, and clam products was responsible for the gain in value. The pack for human consumption was 42 million pounds above that of 1960, while the pack for bait and animal food was down 88 million pounds. The increase in the production for human food resulted from larger packs of salmon, tuna, and mackerel. The reduced pack of animal food shown in the tabulations is largely the result of a change in the classification of this item. Animal food containing less than 10 pounds of fish per standard case of 48 pounds has been excluded from the tabulations. The pack containing less than 10 pounds per case amounted to 2,473,272 standard cases in 1961. The value of two items—canned salmon and tuna—accounted for 72 percent of the total revenue received by producers of canned fishery products.

Tuna:--The pack of tuna totaled a record 15.8 million cases valued at a new high of \$189 million. Compared with 1960, this was an increase of 462,000 cases and \$16 million. The United States catch of tuna (334 million pounds) was 36 million pounds greater than in 1960 and the largest since 1950. Imports were less than in the 2 previous years. Of the total United States pack, 56 percent was canned from the domestic catch, 7 percent more than in 1960.

Salmon:--The 1961 pack of salmon amounted to 3.7 million cases valued at \$117 million. Compared with 1960, production was up 862,000 cases (30 percent) and the value, \$28.8 million (33 percent). Most of the increase occurred in Alaska. The catch of red salmon in Western Alaska and pink salmon in Southeastern Alaska was above the previous 10-year average. The Puget Sound catch was disappointing due to poor runs of red and pink salmon to the Fraser River.

Mackerel:--The 1961 pack of mackerel (1.4 million cases valued at \$8.5 million) was the largest since 1952. Compared with 1960, this was an increase of 444,000 cases and \$2.7 million. Jack mackerel accounted for 72 percent of the pack. The supply of mackerel was plentiful, and canners set catch quotas during virtually the entire season.

<u>Sardines:</u>—The 1961 pack of Pacific sardines (419,000 cases valued at \$3.7 million) was the fourth smallest since World War 1. Compared with 1960, the pack was down 197,000 cases or 32 percent and \$995,000 or 21 percent. Sardines failed to appear in volume off southern California. Fishermen reported the fish to be wild, making it impossible to take large catches on single sets.

In Maine, the industry was staggered by the shortest pack (754,000 cases valued at \$7.6 million) in 23 years. Compared with 1960, production was down 62 percent in volume and 55 percent in value. There was no clear-cut explanation for the shortage of fish in inshore areas. There were indications of plentiful supplies of fish offshore throughout the season. As a result of scarce supply, the Maine State Legislature extended the season an additional 5-1/2 months.

Oysters:--The 1961 oyster pack totaled 446,000 cases valued at \$5.8 million. Compared with 1960, this was an improvement of 35,000 cases in volume and \$136,000 in value. The 1961 production of oyster specialties (smoked, stew, bisque, and soup) amounted to 141,000 cases compared with 126,000 cases in 1960.

<u>Crabs:</u>—A record pack of 256,000 cases of crab meat valued at \$7.2 million was canned in 1961. Compared with 1960, this was an increase of 45,000 cases and \$1.8 million. The pack of blue crabs along the Atlantic and Gulf Coasts was down 39 percent. However, in Alaska, the pack of king crabs increased from 100,000 cases in 1960 to 153,000 cases in 1961. Total production of canned Dungeness and king crabs on the Pacific Coast was 42 percent greater than in 1960.

Shrimp:--The 1961 pack of shrimp amounted to 619,000 cases valued at \$12 million. Compared with 1960, production was down 35 percent in volume and 32 percent in value. The pack in the Gulf States was down 392,000 cases due to a 35-percent decrease in the South Atlantic and Gulf shrimp catch. On the Pacific Coast, the pack increased by 60,000 cases due to a 120-percent increase in the Alaska pack.

Animal food:--The 1961 pack of animal food containing 10 pounds or more of raw fish per standard case (48 one pound cans) amounted to 6.9 million cases valued at \$39 million. A pack containing less than 10 pounds of fish per case, amounting to 2.5 million cases, valued at \$9.1 million, was also canned.

# **GENERAL REVIEW**

# INDUSTRIAL FISHERY PRODUCTS

The production of industrial fishery products by 170 plants in the United States, American Samoa, and Puerto Rico in 1961 was valued at \$74.6 million. Compared with 1960, this was an increase of \$8 million.

Marine animal scrap and meal:--Production increased from 290,000 tons in 1960 to 311,000 tons in 1961 establishing a new record. Menhaden meal accounted for 80 percent of the total.

In the spring of 1961, concern was expressed over the decline in the price of fish meal. An international meeting was held in Rome to assess the world demand for fish meal and to explore possibilities of insuring stable international markets for this product. By the end of 1961, (although United States production and imports were the largest in history) meal was in short supply. Prices had shown a marked recovery, and dealers were actively seeking new sources of supply.

<u>Marine animal oil</u>:--Over 34 million gallons were produced in 1961. Compared with 1960, this was an increase of 6.5 million gallons. The 1961 production was the largest since 1939 when the California sardine fishery was at its peak. Menhaden oil (31.4 million gallons) accounted for 91 percent of the total 1961 production.

<u>Solubles and homogenized condensed fish</u>:--Although production increased from 99,000 tons in 1960 to 112,000 tons in 1961, it was well below the 165,000 tons manufactured in 1959. Some firms added solubles to their meal. This caused production to be reported as meal rather than solubles.

Other industrial products: --Products from oyster shells and buttons from fresh-water and marine mollusk shells were valued at \$9.4 million in 1961. Compared with the previous year, this was a decrease of nearly \$1 million.

Other industrial products manufactured in 1961 included agar-agar, fish feed pellets and animal feeds, Irish moss extract, kelp products, liquid fertilizer, mollusk shell lime, pearl essence, and crab shells valued at \$13.4 million. In the previous year, other industrial products were valued at \$13.8 million.

# PACKAGED FISH

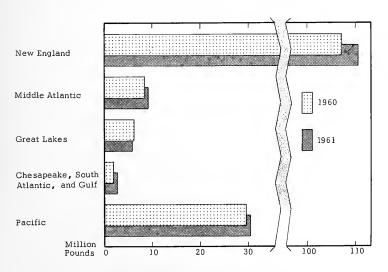

The production of fresh and frozen packaged fish fillets and steaks in the United States during 1961 totaled 158.1 million pounds valued at \$51.8 million to the processors. This was an increase of 4.9 million pounds or 3 percent in volume and \$3.3 million or 7 percent in value compared with 1960. It was estimated that round fish weighing 448.6 million pounds were required for the 1961 production of packaged fillets and steaks.

Haddock fillets (38.2 million pounds) and Atlantic ocean perch fillets (37.5 million pounds) were the leading items and accounted for 48 percent of the total volume and 41.5 percent of the total value. Other leading items filleted and steaked were flounders, cod, halibut, and pollock which made up 37 percent of the total quantity and 42 percent of the total value. The greatest production of packaged fish occurred in the New England area which accounted for 70 percent of the volume and 61 percent of the total value.

Preliminary data on the production of packaged fish during 1961 have been previously published in Current Fishery Statistics No. 2861.

# FROZEN FISHERY TRADE

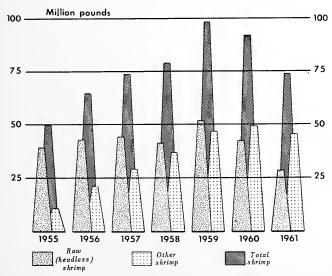

The 1961 production of frozen fish and shellfish by firms reporting to the Bureau of Commercial Fisheries totaled 319.6 million pounds. Leading products frozen during 1961 were shrimp (74 million pounds); bait and animal food (67.6 million pounds); blocks, fillets, and steaks consisting largely of ocean perch and haddock (56 million pounds); halibut (32.7 million pounds); and headed and gutted whiting (29 million pounds). These items accounted for 81 percent of the total. An estimated 509 million pounds of fish and shellfish (live weight) were required to produce the 1961 production of frozen fishery items.

New England led all other areas in freezings with 143 million pounds or 45 percent of the total, followed by the South Central with 57.3 million, the Pacific, 41.3 million, Alaska, 36 million, and the South Atlantic area, 30.9 million pounds. The Middle Atlantic, North Central East, and North Central West areas accounted for the remainder.

Data on the freezings and holdings of fishery products for 1961 were published previously in Current Fishery Statistics No. 2808. The data were also published in the monthly bulletin Frozen Fish Report, which is in the Current Fishery Statistics series.

### COLD STORAGE HOLDINGS OF FROZEN FISHERY PRODUCTS

Holdings of frozen fishery products in 1961 were highest on January 1, when 230.5 million pounds were in storage. The low point occurred 4 months later on May 1, when stocks totaled only 150.2 million pounds.

Shrimp was the principal item held in storage throughout the year, with cod (blocks) and fillets) in second place.

The failure of the shrimp fishery in the South Atlantic and Gulf States was reflected in a sharp decline in the stocks of these shellfish during the year, which fell from 54.5 million pounds on January 1, to 28.3 million pounds at the end of the year.

# COLD STORAGE HOLDINGS OF CURED FISH

Average monthly holdings of salted and smoked cured fish in 1961 totaled 13.5 million pounds. Cold storage stocks averaged 6.8 million pounds of cured herring and 3.5 million pounds of mild-cured salmon. These two species accounted for 77 percent of the average cold storage inventories of cured fish.

# FOREIGN FISHERY TRADE

United States foreign trade in fishery products (imports plus exports of domestic products) was valued at \$432 million in 1961—an increase of \$27.5 million compared with the previous year. The value of fishery products imported for consumption was \$397 million—the highest on record. It exceeded the former record established in 1959 by 8 percent and was 10 percent above the 1960 figure. The value of fishery products exported was \$35 million—a decline of 21 percent from the previous year.

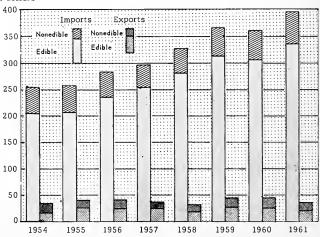

Imports of edible products in 1961 totaled 1.1 billion pounds valued at a record high of nearly \$336 million. Compared with 1960, the volume remained about the same, but the value increased by 9 percent. This gain was due to generally higher prices and changes in composition of the receipts. Major increases occurred in imports of groundfish fillets and blocks, fresh or frozen shrimp, tuna canned in brine, and sardines. Items imported in reduced volume included canned salmon and fresh or frozen sea herring, and tuna. Imports of nonedible fishery products amounted to over \$61 million--16 percent more than in 1960. Gains in receipts of fish meal, sperm whale oil, and cultured pearls accounted for the increase.

Edible fishery products exported in 1961 totaled 40 million pounds with a value of \$19.6 million—a decrease of 35 percent in quantity and 24 percent in value compared with the previous year. Exports of nonedible domestic products, valued at \$15 million, were 18 percent less.

Included in the foreign trade tables this year, for the first time, are statistics on exports of foreign fishery products. These exports during 1961 amounted to \$6.5 million compared with \$3.4 million the previous year.

#### AGE OF FISHING VESSELS

In connection with compiling statistics on the fisheries for 1961, there was assembled, for the first time, information on the age of the United States fishing fleet. The data revealed that a vessel built in 1865 was fishing commercially nearly 100 years later. The vessel, presently named <u>Virginia</u>, operating out of Tampa, Florida, was constructed by a Fish River, Alabama builder about the end of the War between the States.

The figures reveal that the Chesapeake sail dredge vessels are the oldest fishing fleet in the United States. The average sail dredger working in Chesapeake Bay was built in 1911. Eighty percent of these craft were built before World War I.

The menhaden fleet of the Gulf of Mexico was found to be built most recently—the average vessel in this rapidly expanding fishery having been built in 1951. The shrimp fleet of the South Atlantic and Gulf followed closely as the average year built for these vessels was 1949.

Few New England otter trawl vessels have been built in recent years. The oldest of the large trawlers operating in 1961 was constructed in 1928, while the average for the entire fleet is 1940. No large otter trawler, operating in 1961, had been built since 1953. The average medium trawler fishing North Atlantic waters was built in 1941. Small trawlers are even older—the average vessel having been built in 1938.

Forty-four percent of the total United States catch in 1961 was made by 180 menhaden vessels operating off the Atlantic and Gulf coasts. While the fleet operating in the Gulf of Mexico is of most recent construction (the average vessel having been built in 1951), the average menhaden seiner operating in the Chesapeake Bay was built in 1915.

When assembling data on the age of vessels, it was found that the year built for 99 of the 11,964 vessels operated in 1961 could not be determined from Bureau of Customs records or other sources. In most instances, these were former undertonnage craft that had been remeasured and found to be of 5 net tons capacity or greater, vessels obtained by commercial fishermen from the Armed Services or other Government agencies, or salvaged craft that had been redocumented. Frequently, the year built is not known for vessels in these categories.

There follow tabulations, covering vessels operated in 1961, on the year built, by regions for individual fisheries. The data have been presented in considerable detail to provide bench-mark information for similar studies that may be made in the future.

## SECTION 2 - NEW ENGLAND FISHERIES

The yield of the commercial fisheries of the New England States (Maine, New Hampshire, Massachusetts, Rhode Island, and Connecticut) in 1961 totaled 760 million pounds valued at rearly 861 million to the fishermen. This was a decrease of 92 million pounds from 1960 and the lowest annual production since 1944. Despite the relatively large (11 percent) decrease in landings, the value dropped only 1 percent. The lower landings were caused by a sharp decline in the catch of low-priced sea herring at Maine ports.

Rhode Island landings were heavier in 1961 than in 1960 due to larger landings used for industrial products. Landings in other States were lower than in the previous year. Massachusetts accounted for 62 percent of the New England landings in 1961, followed by Maine (26 percent), and Rhode Island (11 percent), Connecticut and New Hampshire accounted for the remaining 1 percent. Of the total amount paid to fishermen, Massachusetts accounted for 61 percent, followed by Maine (31 percent), Rhode Island (5 percent), Connecticut (2 percent), and New Hampshire (1 percent).

The major species contributing to the decline in total landings at New England ports was sea herring. The 1961 catch of only 58 million pounds was 97 million pounds less than the 155 million pounds landed in 1960. Landings of menhaden, ocean perch, whiting, and lobsters were also lighter than in the previous year, Cod, yellowtail flounder, haddock, unclassified fish for reduction and animal food, sea scallops, and Irish moss were taken in greater volume than in 1960.

New England weather was severe at times. Conditions early in 1961 were hazardous due to blizzards and ice formations. Fishermen reported that wind velocities and heavy seas were the worst in many years. Temperatures in February were the lowest in 20 years. During the fall, hurricane "Esther" threatened. The fleet was given advance warning, and all craft were in port as the storm passed by. Damage was limited to loss of lobster gear and fishing time.

The number of fishing vessels of 5 net tons or over (738 vessels) operating from New England ports in 1961 showed a decline of 4 vessels. There were 197 fewer craft in the boat and shore fishery. Fourteen vessels and seven lives were lost at sea during 1961. Five new vessels were added to the New Bedford fleet. A number of older vessels entered the fleet for the first time and helped to compensate for some of the losses. The Fishery Loan Fund, authorized by the Fish and Wildlife Service Act of 1956, received 25 applications for loans from New England vessel and boat owners in 1961.

The total value of fishery products manufactured in New England was \$108 million, down \$9 million from 1960. This decrease was due to the poor Maine sardine production. The pack fell from nearly 2 million cases valued at \$17 million in 1960, to only 754,000 cases valued at \$7.6 million in 1961.

Landings of groundfish (cod, haddock, hake, pollock, cusk, and ocean perch), amounting to 336 million pounds, were 3 percent above those of the previous year. Haddock landings (133.5 million pounds) were 15 million pounds larger than in 1960, and cod (42 million pounds) was up 7 million pounds. The catch of ocean perch fell from 141 million pounds in 1960 to 132 million pounds in 1961. Imports continued to provide an ever-increasing percentage of the United States supply of groundfish fillets. Imports accounted for 68 percent of the total 288 million pounds. In 1951, only 37 percent of the supply of groundfish fillets was derived from imports.

Ocean perch landings were the lightest since 1945. Landings at Maine ports (77 million pounds) were about the same as in 1960. The catch landed in Massachusetts (55 million pounds) was 8 million pounds less than in 1960 and the lowest since 1936. The smaller ocean perch catch followed a 10-year trendof decreasing landings. The decline, due in part to a lack of fish on local grounds, has been principally caused by a lack of efficient vessels to prosecute the fishery. The last new vessel entered the Massachusetts ocean perch fishery in 1952.

### **NEW ENGLAND FISHERIES**

Haddock landings totaled 133.5 million pounds, the best year since 1956 and an increase of 13 percent over 1960. The number of vessels operating in this fishery declined and those remaining made fewer, but more productive trips. The greater percentage of the catch was made up of scrod-size fish from the 1958 year class.

A report, Circular 121, entitled <u>The Groundfish Industries of New England and Canada</u> was issued by the Bureau of Commercial Fisheries in 1961. It is a comparative economic analyses made by the Bureau of Business Research of Boston College, under contract. Based on the findings and analyses presented in the report, the following conclusions were drawn:

- (1) Four basic differences exist between the fishery industries of the New England and Atlantic Provinces. These four are geographic locations, structures, organizations, and the economic framework within which the two industries operate. They account for the competitive advantage enjoyed by Canada.
- (2) The Canadian industry, which engages in a diversified fishery, is less affected by declines in abundance of a particular species than is the New England industry, which is composed of groups of specialized fisheries, each heavily dependent on the abundance of a particular species.
- (3) The Canadian subsidy program directly benefits only the small trawler operators and not the large integrated firms which are the chief competitors of the New England industry. These firms benefit from the subsidy only to the extent that it enables them to buy the catch of the subsidized vessels and thus avoid incurring the overhead costs of large trawlers which they might add to their own fleets.
- (4) Foreign competition is an important source of the problems of the New England industry. Nevertheless, the industry's lack of ability to adjust to diminished but relatively stable resources is also important.
- (5) To the extent practicable, the New England fleet should seek to diversify its catch and lessen the dangers of dependence on one species.
- (6) The Boston trawler fleet includes a number of marginal boats engaged in uneconomic overfishing. Because of the limited resources which the Boston fleet can now effectively harvest, these vessels will be eliminated by the process of attrition which has been taking place since 1948. Thus, contraction rather than expansion is postulated for the Boston trawler fleet.
- (7) Not only contraction, but also <u>concentration</u> is postulated for the Boston industry: i.e., the Boston fleet may eventually be characterized by a small number of operators, each owning many boats. In any event, only in this way can the economics of a scale necessary to efficient operation in this high-cost industry be accomplished.
- (8) The ocean perch fleet in Gloucester and Maine also faces contraction because of the decline in productivity on the more distant ocean perch grounds.

Yellowtail flounder landings in 1961 (37 million pounds) were 7 million pounds or 24 percent larger than in 1960. It was one of the best years on record for this species. Age and growth studies showed that the increased catch was due to a strong 1958 year class that furnished most of the catch.

The failure of the sea herring (sardine) fishery brought hardship to Maine fishermen and fishing communities. The catch of 54.5 million pounds was the lowest since 1940 and approximately one-third of the amount landed in 1960. The total canned pack of sardines amounted to only 754,000 cases—down 62 percent from 1960. In an effort to help the industry, a temporary measure was passed by the Maine legislature ending all seasons and placing the fishery on a year-round basis until January 1, 1963. Imports of sea herring from Canada also declined. They amounted to only 43.9 million pounds compared with 74.3 million pounds in 1960. Imports of canned sardines packed in oil were up 31 percent while non-oil packs were up 138 percent. While this alleviated the consumer shortage resulting from the poor domestic season, it also caused fears about the possible loss of markets to products of foreign countries.

The Massachusetts whiting fishery faced a number of problems in 1961, and landings fell to 74 million pounds—a decline of 13 million pounds. In other States, landings increased. The start of the Massachusetts season at Gloucester was delayed until June by a price disagreement. Landings in June totaled 7 million pounds. In July, they jumped to 18 million pounds—a new high for any one month. Faced with a deluge of fish, processors began to worry about heavy inventories, and the price paid to fishermen dropped. Although the fleet refused to fish for a short time and several large vessels withdrew from the fishery, most craft resumed fishing at a reduced price.

Total landings of fish for industrial purposes equaled the low catch of 1960 and continued to reflect the oversupply of industrial products on the world's market. Prior to the decline in world meal and oil prices in 1959, the fishery was an important segment of the New England Fishery. To the small otter trawl fishermen, it presented an opportunity to turn a slight loss for the year into a profitable operation. The ruling by United States Food and Drug Administration, which prevented the use for human consumption of so-called fish protein concentrate, made from whole fish came as a blow to some producers who had plans to convert to this type of operation.

The catch of menhaden (26 million pounds) was 17 million pounds less than in 1960. Due to a shortage of fish north of Cape Cod, landings in Massachusetts amounted to only 3.4 million pounds compared with 18.0 million pounds the previous year.

The Provincetown tuna purse seiner  $\underbrace{\text{Silver Mink}}_{\text{test}}$  was joined in the 1961 season by a new steel vessel built in Warren, Rhode Island. The  $\underline{F}$ . Nelson Blount is believed to be the first tuna seiner ever to be built on the Atlantic Coast of the United States. The 1961 catch of bluefin tuna in New England was 2.4 million pounds, nearly all of which was taken by these two seiners. The longline fishery was disappointing. Tuna did not appear to take bait as readily as in other years, and the presence of unusually large numbers of grayfish interfered with the use of the longlines. Hope continued that a profitable fishery for tuna could be developed in New England.

While the shellfisheries of New England accounted for only 9 percent of the volume landed in 1961, they accounted for nearly half (47 percent) of the total value paid to fishermen. The value of northern lobsters and sea scallop meats amounted to \$23 million or 79 percent of the total value of the shellfish harvest. The 1961 production of lobsters (26 million pounds) was 3 million pounds less than in the previous year. However, the value of the catch (\$14 million) was the second highest on record.

A record catch of sea scallops was landed in New England in 1961, when 24 million pounds of meats, valued at \$9 million, were recorded. The amount paid to fishermen (\$9 million) was less than the record \$9.8 million paid in 1959 for 20 million pounds of sea scallop meats. Sea scallop imports from Canada in 1961 amounted to 8.6 million pounds—2 million pounds higher than for 1960. As a conservation measure, many sea scallopers have now adopted the use of 4-inch rings instead of the 3-inch formerly used in sea scallop dredges. In addition to conserving small stock, the larger rings result in a cleaner catch of the shellfish.

The Massachusetts Division of Marine Fisheries set up regulations concerning sanitary rules for sea scallop vessels, boats, and processing plants. Every craft and plant must be inspected and certified. The regulations will go into effect on January 1, 1962. Separate rules for bay scallopers will become effective on October 1, 1962.

Large numbers of Russian and some Polish vessels fished Georges Bank in 1961, and their presence caused concern. They were first reported in this area in 1960. Up to 100 vessels were reported at one time, including stern trawlers, gill netters and motherships. Apparently, the fleet fished mostly for herring.

The first application for benefits under the Fishery Vessel Construction Differential Subsidy program was filed by a New Bedford fishermen in April 1961. The Act was approved on June 12, 1960 to provide financial assistance in smoothing out differences in cost between foreign and domestic construction of fishing vessels. Under this Act, the Secretary of the Interior is authorized to pay up to one-third of the cost of construction of a new fishing vessel providing the proposed vessel, owner, and the fishery in which it will engage meet certain requirements. At the present time, the New England groundfish industry is the only fishery meeting the requirements of the program.

The Area Redevelopment Act was signed into law on May 1, 1961. In November, financing was approved for a study by the New Bedford Institute of Technology of the sea scallop and flounder industries. The Institute was authorized to spendup to \$100,000 in a market research study and a survey of present processing facilities. The purpose of this study is to provide additional jobs in this depressed area.

The Bureau's new aquarium building at Woods Hole was completed in April. The acquisition of this new facility was of twofold importance, for it provided, once again, a public attraction which had been missing since 1954, and it furnished the laboratory a much-needed research adjunct. The aquarium was opened to the public on July 1, 1961.

During the year, voluntary grade standards, developed by the Bureau, became effective for frozen fried breaded scallops, and proposed standards were developed for frozen sole and flounder fillets. Product standards had previously been established for frozen fish sticks, fish blocks, haddock fillets, cod fillets, ocean perch fillets, and breaded portions.

Construction on the fishery research vessel <u>Albatross IV</u>, which will replace the former <u>Albatross III</u> began during the year. This vessel is being constructed under the national oceanographic program and will cost \$1.8 million. The vessel will be 187 feet long with a beam of 33 feet. There will be berthing space for a 25-man crew and 16 scientists. The vessel is the first stern trawler to be built in the United States. It is designed for use in fisheries and oceanographic research in any navigable waters in the world.

The Massachusetts frozen food code went into effect early in the year. The most important provision with respect to the fisheries is that a temperature of  $0^{\circ}$  F. must be maintained throughout the distribution chain.

The Massachusetts Advisory Commission on Marine Fisheries submitted a report of the State's marine fishery programs and problems to the Governor in January 1961. The report, based on a comprehensive study, included 16 specific recommendations. The major ones were:

(1) The Director of Marine Fisheries be given increased authority to regulate the fisheries,

(2) An advisory commission be made permanent, and (3) an accelerated program of research management be authorized.

The University of Rhode Island acquired its first oceanographic research vessel in 1961. The vessel (a 17-year-old, 180-foot former Army freighter) had been in mothballs at Rio Vista, Calitornia. The vessel will be fitted to carry on research in physical, chemical, geological, and biological oceanography. It will have quarters for 21 scientists and a crew of 15 men.

The increased activity of skin diving enthusiasts, particularly in the lobster fishery, continued to cause concern among other commercial fishermen. In 1961, the Maine legislature passed a law prohibiting the taking of lobsters by skin divers. New Hampshire already has such legislation. In an elfort to counteract unfavorable comments on alleged activities of skin divers, several of the diving organizations assisted in locating and salvaging gear lost by commercial fishermen. They also contributed their time and resources to scientific research under government leadership.

Legislation was enacted by Maine in 1961 for the purpose of preventing the Gloucester fleet of whiting vessels from fishing in Casco Bay. This was accomplished by restricting vessel size and gear size to be used in the area. The denial of this area to the Gloucester vessels created only slight inconvenience and had little bearing on the overall catch. Maine vessels made better catches due to the elimination of some competition.

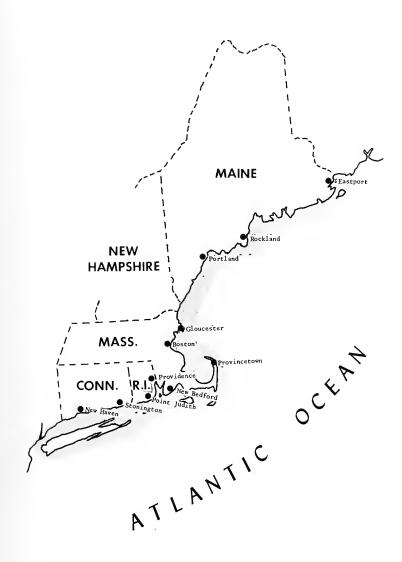

A law passed by the Canadian government had a direct effect upon the New England industry. A 4-inch minimum length law for sea herring, similar to legislation in Maine, was placed in effect. Previously, fish smaller than 4 inches were caught in Canada, exported, and packed in Maine.

Labor-management relations were fairly amicable along the New England waterfront in 1961, and several new contracts between labor and management were negotiated. The most serious dispute occurred in Gloucester when a 71-day impasse between stevedores and their employers blocked imports of frozen fish at this port. Since the cargo carriers were diverted to other ports, no work stoppages resulted at the fish stick and portion plants which are so dependent upon this source of raw supply. A 5-day work stoppage in New Bedford ended in the signing of a 3-year contract by shore workers and processors. New Bedford fishermen and vessel owners also reached agreement on a 3-year contract. New working agreements were also reached by shore workers and employees in Gloucester and on Atlantic Avenue in Boston. Wage increases for the most part were moderate.

The Bureau acknowledges the assistance of the following organizations in the collection of data appearing in this section: The Maine Department of Sea and Shore Fisheries; the New Hampshire Fish and Game Department; the Massachusetts Department of Natural Resources, Division of Marine Fisheries; the Rhode Island Department of Agriculture and Conservation, Division of Fish and Game; the Connecticut State Board of Fisheries and Game; and the Connecticut State Shell Fish Commission.

The following tables contain summarized and detailed information on the 1961 operating units and catch of fish and shellfish in the New England States. Condensed summary data on the operating units and catch by States of the New England area, appearing on the following pages, have been previously published in Current Fishery Statistics No. 3010. Additional data on many aspects of the New England fisheries may be found in the Maine, Massachusetts, Rhode Island monthly and annual landing bulletins released by the Branch of Statistics and in daily, monthly, and annual reports published by the Bureau's Fishery Market News Service, Commonwealth Pier, Boston, Massachusetts.

### RHODE ISLAND CATCH 1960-61

### LANDINGS AT MAINE PORTS

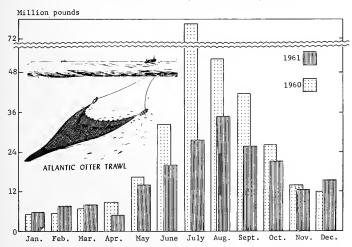

The Bureau of Commercial Fisheries, in cooperation with the Maine Department of Sea and Shore Fisheries, collects and compiles monthly and annual data on the landings of fish, shell-fish, and other aquatic resources in the State of Maine. This information is published in the monthly bulletin, Maine Landings, in the Current Fishery Statistics series of reports. Additional detailed tabulations are prepared for the use of Bureau and State scientists and the International Commission for the Northwest Atlantic Fisheries.

Maine landings data, summarized by species and months, appeared in Digests for the years from 1947 to 1958. Since the latter year, information on the Maine catch by gear and subarea has been substituted for the monthly tabulations. The quantities shown represent the round weight of all species except univalve and bivalve mollusks. These shellfish are reported in pounds of meats. The data are comparable with catch figures shown in other tables in this report.

In 1961, landings at Maine ports by fishing craft of all sizes amounted to 198 million pounds —down nearly 94 million pounds compared with the previous year. The decrease was caused by a sharp reduction in landings of sea herring, which dropped to 54 million pounds from 152 million pounds in 1960. The decline of this fishery resulted from failure of the herring to move in quantity into the shallow waters where they are usually taken. Late in the season, a few purse seiners fished the offshore waters with limited success. Landings of haddock, ocean perch, crabs, and lobsters also fell below the 1960 level.

The 1961 landings of whiting and sea scallops gained slightly over those of the previous year. However, the greatest increase occurred in the production of sea moss, which yielded over 5 million pounds in 1961 compared with about 500,000 pounds in 1960.

### LANDINGS AT MASSACHUSETTS PORTS

Detailed statistics are collected and published monthly and annually on landings at Boston, Gloucester, New Bedford, and other Massachusetts ports. Additional detailed tabulations are prepared for the use of Bureau and State scientists and the International Commission for the Northwest Atlantic Fisheries. The data usually represent about 98 percent of the total Massachusetts catch.

A summary of 1961 data on Massachusetts landings by ports and by gear and area of capture is contained in the following tables. Since the quantities shown represent the actual weights of the landings, they are not directly comparable with the catch figures which appear in other tables in this Digest. The Statistical Digests published prior to 1959 contained information on monthly landings by species at individual ports.

Landings by fishing craft of all sizes at Boston, Gloucester, New Bedford, and certain other Massachusetts ports in 1961 amounted to nearly 432 million pounds valued at \$33 million. Compared with 1960 (444 million pounds valued at \$32 million), landings declined 3 percent in volume but increased 3 percent in value. During 1961, receipts at Gloucester accounted for 38 percent of the total production but only 18 percent of the total value. Boston was second both in quantity (27 percent) and value (29 percent). New Bedfordranked third in volume (23 percent) but led in value with 45 percent of the landings. Production at other Massachusetts ports made up the remaining 12 percent in quantity and 8 percent in value.

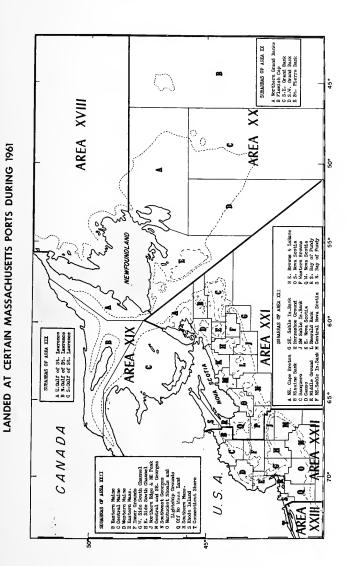

At Boston, landings of 117 million pounds reflected a 7-million-pound increase over 1960, although the value declined slightly. The gain in volume was due principally to increased receipts of haddock, which comprised 72 percent of the total. Landings of scrod haddock were the heaviest in 5 years. Other species taken in considerable quantity were cod (16 percent) and pollock (7 percent).

Gloucesterlandings were larger than those at any other Massachusetts ports but were the lowest since 1947. Ocean perch was the leading species in both volume and value, although landings of these fish (54 million pounds) were the smallest at this port since 1939. However, ocean perch continued to provide more employment and yielded fishermen agreater return than any other species in the Gloucester fishery. Receipts of whiting (51.6 million pounds) were nearly 12 million pounds below the 1960 production. Whiting landings dropped below those of ocean perch for the first time in 2 years and were the lowest since 1958.

Landings at New Bedford (100.5 million pounds) were 8 percent above those of 1960. The increased volume resulted from gains in landings of yellowtail flounders, haddock, cod, and scallops, and resumption of menhaden landings. Although landings of yellowtail flounders (30.2 million pounds) were 28 percent more than in 1960, they were still considerably below the record 36.7 million pounds landed in 1942. The predominance, of high-priced species, such as flounders and scallops, enabled New Bedford to retain the position of second ranking port in the nation in ex-vessel value of fishery products.

A total of 712 fishing craft was required to capture the 432 million pounds of fish and shellfish landed at Massachusetts ports in 1961. Of this number, 414 craft operating otter trawls caught 86 percent of the total landings. Purse seines accounted for 6 percent; scallop dredges, 5 percent; and the remainder was taken on lines, in pound and trap nets, by harpoons, or with gill nets. Fishing grounds off New England yielded 359 million pounds or 83 percent of the entire landings. About 16 percent was taken on grounds off Nova Scotia, while the remaining 1 percent came from the Gulf of St. Lawrence, the Grand Bank, and from areas off the Middle Atlantic States.
