NOTE:--THE CATCH OF 10,513,200 POUNDS OF CATFISH AND BULLHEADS (VALUED AT \$1,471,848) AND 444,500 POUNDS OF SOFT-SHELL TURTLES (VALUED AT \$22,225) TAKEN FROM THE INLAND LAKES IS INCLUDED WITH THE CATCH FOR THE EAST COAST OF FLORIDA.

#### SOUTH ATLANTIC SHRIMP FISHERY

Landings of shrimp at ports in the South Atlantic States during 1961 totaled 11.8 million pounds, heads-off weight, with a dockside value of \$6.9 million. Compared with the previous year, this was a decline of 37 percent in volume and 18 percent in value. The 1961 landings were the smallest for any year in which data have been collected by the Bureau of Commercial Fisheries in the South Atlantic States since 1918.

Georgia again led in the production of shrimp with landings of 4.1 million pounds, heads-off, followed by East Coast of Florida, 3.6 million; South Carolina, 2.3 million; and North Carolina, 1.8 million.

The average price per pound, heads-off, for shrimp delivered at the dock, all States combined, increased from approximately 46 cents during 1960, to 59 cents during 1961. The increase in price only partly compensated for the greatly reduced catches.

A comparison of the species composition of the 1960 and 1961 landings indicates that the greatest decline occurred in landings of brown shrimp (<u>Penaeus aztecus</u>), which decreased over 4 million pounds, or 72 percent; and white shrimp (<u>Penaeus setiferus</u>) down 3 million pounds, or 25 percent. A slight increase of 326,000 pounds occurred in the landings of pink shrimp (<u>Penaeus duorarum</u>).

There were no significant changes in the count size composition of the landings as compared with the previous year. The 31-40 (heads-off) count size category accounted for 26 percent of the landings; 26-30 count, 23 percent; and 15-25 count, 21 percent. The remaining 30 percent of the landings consisted of 41-and-over count shrimp.

The quantities shown in the following tables are based on the heads-off weight of the shrimp and are not directly comparable with the volume data published in the General Review, regional tables, or the Review of Certain Major Fisheries, which represent the round weight of the catch. The pounds of heads-off shrimp may be converted to heads-on weight by multiplying by 1.68.

Information on the landings of shrimp in the South Atlantic States contained in the following tables has been previously published in Current Fishery Statistics No. 2957. Monthly data on landings of shrimp in the Gulf States by species, size, volume, and landed value in each State; the number of fishing trips; days fished; and the catch by area, depth, and size of shrimp are included in Section 6 of this Digest.

## **SECTION 6 - GULF FISHERIES**

The commercial catch of fish and shellfish landed at ports of the Gulf States (West Coast of Florida, Alabama, Mississippi, Louisiana, and Texas) during 1961 amounted to 1.4 billion pounds with a dockside value of \$76 million. The volume of landings established a new record surpassing the previous, recorded in 1960, by over 111 million pounds or 9 percent. This was due to record menhaden landings. Value of the landings decreased approximately \$10 million or 12 percent from that of 1960; the disastrously low shrimp catches were the reason for this substantial decline in value. The year presented a mixed economic situation in the fisheries of the Gulf States. The catch of shrimp (133.8 million pounds) was 35 percent less than in 1960, however the value of the catch (\$43.6 million) accounted for 58 percent of the amount paid Gulf fishermen for all species. Menhaden landings (1,020 million pounds) were a new record and catches of crabs (36.3 million pounds) and oysters (18.2 million pounds) were considerably above average.

Louisiana again led all Gulf States, as well as all other States in the Nation, in volume of landings as a result of continued record menhaden production. Texas continued its position, among the Gulf States, as the leader in terms of value of landings. Increases in volume, compared with 1960, were recorded in only two States--Mississippi, with a 77-million-pound (25 percent) increase, and Louisiana, with a 82-million-pound, (14 percent) increase. Both increases resulted from greater menhaden landings. Alabama landings declined 3.6 million pounds; Texas, 44.4 million; and Florida, West Coast, 10.2 million pounds. The value declined in each State and ranged from a substantial drop of \$4.5 million in Louisiana to a \$57,000 decrease in Mississippi.

As is usually the case, five species predominated the landings and accounted for 90 percent of the total. Shrimp, the most valuable species, decreased 72 million pounds from 1960. Menhaden, the perennial leader in volume, increased 179.5 million pounds; oyster meats and mullet landings each increased by 2 million pounds; and crab landings were up 577,000 pounds compared with 1960.

Weather conditions in most of the area did not follow the normal seasonal patterns during 1961. Heavy rains, with accompanying floods, were experienced in most States during the early spring. In these same areas, an unseasonably warm period in January was followed by unusually prolonged cold weather. The area was struck by one hurricane during the year. Hurricane Carla hovered off the Texas coast and smashed inshore on September 11. Shore plant installations and craft at Palacios and Port O'Connor were completely destroyed as the "eye" moved ashore at this point on the coast. Shore plants at Freeport and Port Lavaca were also heavily damaged. Water damage, as a result of this hurricane, was inflicted on other shore plant installations along the Texas and Louisiana coasts. Adequate warning permitted craft operators to seek harbors of safety so that losses were minimal. Heavy gear losses occurred in the net and trotline fisheries, particularly in Matagorda Bay and adjacent areas, as a result of this storm. Fishing along the Texas coast was curtailed for approximately 10 days as a result of this hurricane. Shortly after the hurricane a short-lived, but heavy, run of shrimp occurred off Port Isabel, Texas. Catches of red snapper in all areas off the Texas and Louisiana coasts also reached unprecedented high levels following the hurricane.

There were 17,615 persons employed by 768 fishery wholesaling and processing establishments in the Gulf area during 1961. The value of processed fishery products, \$144 million, was \$5 million less than in 1960.

Landings of shrimp declined drastically during 1961, and ex-vessel prices increased moderately. However, the decline in volume was so great, and followed so closely the low prices of 1959, that vessel operators were in financial difficulty by midyear. At the close of the year, all major shrimp organizations were seeking to have their Legislators amend the provisions of the Farm Disaster Act to include fisheries which suffer "crop failures" as a result of natural causes. Biological research on shrimp had not reached the stage where the specific factors

causing the decline in population abundance could be clearly delineated. However, speculation among many biologists and longtime fishermen was that abnormal water temperatures and salinities were prime factors affecting this decline. A slight measure of relief was afforded by the relatively higher ex-vessel prices during the last quarter of the year. This is well illustrated by the fact that while landings declined 35 percent, the value of these landings declined only 24 percent. This relationship between declines in volume and value is especially significant since there was very little change in the size composition of the shrimplandings compared with the previous year.

The decline in shrimp populations was apparent in nearly all major fishing areas of both the coastal and offshore waters of the Gulf of Mexico, and was reflected in greatly decreased landings in each of the States. Those States comprising the North Central Gulf (Alabama, Mississippi, and Louisiana) sustained decreases of 51, 60, and 50 percent, respectively. Landings at Texas ports declined 28 percent below 1960, while those on the West Coast of Florida were down 19 percent. A review of the species composition of landings in each State indicates that there was a "crop failure" of both brown (Penaeus aztecus) and white (Penaeus setiferus) varieties, with the greatest decline in stocks of brown shrimp.

The average ex-vessel price per pound, heads-off weight, during 1961 was nearly 55 cents-up 8 cents from the 1960 average. The greatest increase was in Texas, where a high of about 61 cents was recorded--10 cents over the previous year. In all other States the increase, over 1960, ranged from 5 to 6 cents per pound. While prices were substantially higher than in 1960, they were, in all States, considerably below those recorded in 1958, the record year.

Production of packaged raw, headless shrimp was 32.4 million pounds below that of 1960; however, peeled and deveined and breaded shrimp showed a gain of 7 percent. The increase in the latter category was made possible by greater imports of shrimp and a reduction in frozen stocks. As a result of short domestic supplies, some experimenting was done to determine the feasibility of using imported frozen shrimp for canning purposes.

A promising new product, <u>Shrimp Logs</u>, was introduced by a Louisiana processor during 1961. Tiny Alaskan shrimp packed into polyethylene sleeves were molded in special forms and quick-frozen at an Alaska plant. The <u>logs</u> were then shipped to the Louisiana plant where the processor sliced them into the desired thickness, while still frozen, and then breaded and packaged the slices. The slices resemble a butterfly-shaped shrimp.

Partially compensating for the greatly reduced shrimp landings of the Gulf area was an ever-increasing quantity of imports, which totaled a record  $126\,$  million pounds. These imports exceeded those of  $1960\,$ , the previous record year, by  $13\,$  million pounds, or  $11\,$  percent.

The menhaden fishery was the most encouraging segment of the Gulf fishing industry. A record 1 billion pounds were landed, surpassing the record year, 1960, by over 179 million pounds. Fish were plentiful in most coastal areas throughout the season (April through October) and were large enough to produce a very good oil yield. Louisiana led all States with landings of 582 million pounds—an increase of 24 percent over 1960—while Mississippi landings reached a new high of 301 million pounds—a 38-percent increase over those of 1960. Texas was the only State in the Central and Western Gulf in which landings decreased from the previous year, probably because of the disruption of fishing activities and scattering of menhaden schools due to hurcane Carla.

Evidence of the abundance of menhaden is perhaps best illustrated by the fact that 69 vessels participated in the taking of this record catch, compared with 76 during 1960. Increased efficiency of fishing operations by the use of pneumatic blocks aboard seine boats, as well as the abundance of fish, contributed to the greater catches of 1961. The use of striker boats in this fishery was practically abandoned as aircraft spotters now perform the function of indicating the location and movement of schools of fish.

Market conditions for the products derived from menhaden were somewhat mixed during the year. Meal and scrap prices remained relatively high, with an average for the Gulf area of \$105 per ton—an increase of \$15 per ton over 1960. Prices for menhaden oil took a downward trend at the close of the season, with an average for the year of about 45 cents per gallon in contrast to approximately 49 cents in 1960. The principal factors in this downward trend were the heavy production of fish oil in Peru and the higher oil yield from menhaden taken from the Gulf of Mexico. The demand for solubles remained light to moderate, and the average price for the year was approximately \$40 per ton.

Landings of over 18 million pounds of oyster meats were the highest recorded by the Bureau since 1939. While landings in Alabama and Texas were less than half those of the previous years, substantial increases in the other Gulf States compensated for these declines. Louisiana, the consistent leader among the Gulf States, accounted for over 55 percent of the area total with slightly over 10 million pounds. West Coast of Florida landings, 3.3 million pounds, were up 1.3 million pounds over 1960, while Mississippi landings increased 850,000 pounds. The average price per pound during 1961 increased 7 cents over that of 1960 for Florida, West Coast production, and 5 cents for Alabama. In the remainder of the States, the average price per pound was at nearly the same level as in 1960.

The principal incentive for increasing production was the strong demand created by the shortage of oysters in the Chesapeake and Middle Atlantic States. The West Coast of Florida moved into second position in both volume and value of landings. As was the case on the East Coast, there was a virtual rebirth of this fishery in Florida, and it is anticipated that production will continue to increase in the future. A further indication of the interest in this fishery was the granting of 33 leases, covering 1,298 acres, by the Florida Board of Conservation to private individuals during 1961.

In Alabama, the drastic decline in production occurred as a result of mortality due to the heavy influx of fresh water in the February floods. Pollution, both industrial waste and sewage, increased as a result of currents generated by these floods. This led to the closing of over 90 percent of the oyster reefs on March 5 for the balance of the spring season. The reefs were reopened for the fall season, but pollution again forced closure of the majority during December.

Texas oyster reefs were in much the same condition as those of Alabama. Abnormal freshwater intrusion and contamination resulting from hurricane <u>Carla</u> were prime factors in the sharply reduced production. One interesting aspect of the Texas fishery was the development of a steel raft for growing oysters. In operation, the raft is towed to the seeding ground and sunk; stringers of plastic strips, attached to upright reinforcement rods, serve as the cultch for collecting spat. This type of operation is designed to save labor in harvesting and also provide mobility in that the raft can be moved to areas having optimum growing conditions for oysters. Conditions for growth and development of oysters in Louisiana and Mississippi were very good and were a principal reason for increased production.

The increase in oyster landings of the Gulf area was reflected in the processed commodities. The canned pack of 324,600 standard cases in Mississippi and Louisiana, the principal producing States in the area, was an increase of 30 percent over that of 1960. Production of shucked oyster meats amounted to 963,000 gallons—up 35 percent over 1960. The 10-ounce glass containers for retail sales of shucked oysters continued to grow in popularity.

Canned oyster prices declined about \$1 per case below the \$13.60 received in 1960, as dealers continued their attempts to compete with the lower priced imports of this commodity. The average price for fresh shucked oysters, for the entire area, was about the same as in 1960.

Landings of choice finfish in the area increased over the previous year in nearly every case. Red snapper landings amounted to 11.9 million pounds—1.6 million pounds more than in 1960, and according to Bureau records, the greatest poundage landed since 1927. Much of the increase was due to new vessels entering the fishery and more efficient gear. The use of a mechanical hand reel with small stainless steel wire reduced effort required to bring fish from the depths and also permitted fishing in deeper waters and using more hooks per line. The relatively high ex-vessel red snapper price (averaging 26 cents per pound) precluded any large-scale filleting operation. Technological developments, such as a reasonably priced fillet machine and more efficient methods of capture, could probably expand the extent of this fishery in the Gulf area.

Landings of fish caught incidental to shrimp trawling, while three times as great as those of 1960, accounted for only 3 percent of the total landings. This increase occurred in both Texas and Louisiana, probably resulting from fishermen seeking to sell any species of value caught incidental to shrimping in order to compensate for monetary losses due to greatly reduced shrimp catches.

Mullet were plentiful throughout most of the year in all States, and the 34.8 million pounds landed were an increase of 2.1 million over 1960. The same technological developments mentioned as needed for red snapper are also applicable to this species. In Florida, the principal producing State, plans were made for accelerating promotional activities for this species. One of the principal determinations to be made, in connection with the promotional program, was the suitability of mullet for canning. A good demand and price structure served as an incentive for a greatly increased production of mullet roe in the West Coast of Florida.

Spanish mackerel landings of 4 million pounds were down 27 percent from the landings of 1960. Spotted sea troutlandings were below those of 1960, because of a decline in the abundance of this species in Florida and Texas. Catches by Alabama, Mississippi, and Louisiana fishermen increased over the previous year. However, it is not known whether greater abundance or intensified fishing effort accounted for the increases in these States.

For the third consecutive year, the West Coast of Florida led all Gulf States in landings of hard, blue crabs. While the landings of 35.3 million pounds for the Gulf area were the highest recorded since 1945, they could have been much greater if a sufficient demand had existed. Processing plant operators were greatly concerned over their ability to pay the new minimum wage and still produce crab meat that would meet consumer acceptance with regard to price. Prior to the application of the minimum wage law, employees were paid on a piecework basis, generally 20 cents a pound for picked meats.

Landings of fresh-water catfish and bullheads from rivers in the coastal areas of the various States continued to provide a substantial contribution in the overall economy of the fisheries. The introduction of a polyethylene package, containing two or three skinned and dressed frozen catfish, was expected to afford a greater sales distribution of this species.

Fishery research conducted by each of the Gulf States remained at relatively high levels during the year. In Alabama, the major efforts of the research program were directed toward getting more production from existing oyster reefs and establishing new reefs by an increased shell-planting program. Plans were also completed for construction of a modern laboratory and Seafoods Division office on Dauphin Island.

As in past years, the Florida State Board of Conservation, Salt-water Fisheries Division, conducted research through its own facilities in St. Petersburg and Apalachicola, and by contract with the Marine Laboratory, University of Miami. Research on fish was primarily devoted to studies of reef fishes and the taxonomy and biology of species comprising an integral part of the food chain. The final report of several years observations on pink spotted shrimp (Penaeus duorarum) was completed and indicated that because of its role in stimulating spawning, temperature may be important in determining the abundance of year classes.

The Marine Laboratory of the Louisiana Wild Life and Fisheries Commission, on Grand Terre Island, continued its research program with a complete staff. Its principal research was hydrographic studies of shrimp and oysters, the primary purpose of which is to establish what may be considered normal environmental conditions compared with abnormal. This information will be correlated with all phases of work on shrimp and oysters. Shrimp research was expanded, with primary emphasis on the brown shrimp (Penaeus aztecus), to determine offshore spawning areas; growth rates, distribution, and movement in inside waters; postlarval arrivals into the bays, including density counts; and histological studies of the reproductive cycle. Oyster research followed much the same pattern as in previous years. Research indicated that excessive fresh water, while limiting available supplies of seed oyster, greatly reduced the snail Thais and the appearance of the disease caused by Dermocystidium marinum.

The Gulf Coast Research Laboratory, Ocean Springs, Mississippi established its own journal called <u>Gulf Research Reports</u>. Volume 1, No. 1, was a paper describing the distribution, with natural history notes, on all marine and brackish water mollusks of the State of Mississippi. Studies continued on menhaden, shrimp, and oysters. The Laboratory participated in a joint study with the Mississippi Marine Conservation Commission and the U.S. Soil Conservation, Service on the sedimentation of Mississippi Sound by a new method which consists of a probe which gives off gamma rays and a receiving apparatus.

The Texas Game and Fish Commission completed a reorganization which divided the activties into five regions. However, general policy and administrative offices remained in Austin. Research emphasis continued to be placed on the life history of species subject to the greatest fishing pressure, both sport and commercial; and hydrographic and environmental studies.

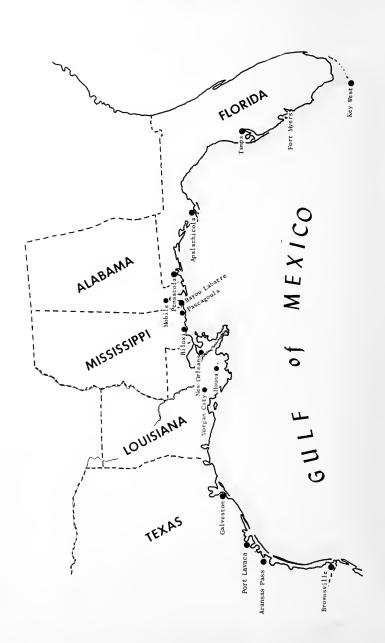

The Bureau of Commercial Fisheries, under the direction of its Regional Office in St. Petersburg Beach, Florida, continued its Research and Services Programs on the major fisheries of the Gulf States. Specific and detailed accomplishments of each of the Branches comprising the Bureau are contained in Report of the Bureau of Commercial Fisheries, Calendar Year 1961, and Operations of the Bureau of Commercial Fisheries Under the Saltonstall-Kennedy Act, Fiscal Year 1961.

Through the efforts of the Gulf States Marine Fisheries Commission, an additional \$175,000 was appropriated by Congress for expanded shrimp research during the fiscal year 1962.

A hearing was held before the Committee on Ways and Means, House of Representatives on H.R. 6168, a bill to amend the Tariff Act of 1930 to impose a duty on shrimp and to provide for duty free entry of unprocessed shrimp annually in an amount equal to imports of shrimp in 1960. The bill was still in Committee at the close of the year.

Condensed summary data on operating units and catch by States appearing on the following pages have been previously published in Current Fishery Statistics bulletin No. 3051. Data on the catch and operating units of the East Coast of Florida and the entire State of Florida may be found in Section 5 of this Digest. Seasonal variations of the catch of fish and shellfish in Florida, Alabama, Mississippi, Louisiana, and Texas can be ascertained from monthly landing bulletins issued currently for these States in cooperation with the fishery agencies of each State. Additional aspects of the Gulf fisheries may be found in daily, monthly, and annual reports published by the Bureau's Fishery Market News Service, Federal Building, 600 South Street, New Orleans 12, Louisiana.

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this Section: Florida State Board of Conservation; Marine Laboratory, University of Miami; Alabama Department of Conservation, Commercial Seafoods Division; Mississippi Marine Conservation Commission; Louisiana Wild Life and Fisheries Commission; and Texas Game and Fish Commission.

## SECTIONAL SUMMARIES SUMMARY OF CATCH, 1961

(MILLIONS OF POUNDS AND MILLIONS OF DOLLARS)

### **GULF SHRIMP FISHERY**

Detailed statistics on landings of shrimp by United States craft at Gulf of Mexico ports were collected during 1961 for the sixth consecutive year. The data, summarized on a monthly basis in the following tabulations, include information on species by size; volume and value landed in each State; the number of fishing trips; days fished; and the catch by area, depth, and size of shrimp. Catch figures represent the heads-off weight and, therefore, are not directly comparable with the heads-on (live weight) quantities published in the General Review regional tables, or the Review of Certain Major Fisheries. The pounds of heads-off shrimp may be converted to a heads-on weight by multiplying by 1.68.

Landings at Gulf of Mexico ports during 1961 totaled nearly 80 million pounds (heads-off)—a decrease of 43 million pounds from 1960 and the lowest since 1949. The dockside value of \$43.6 million was a decrease of \$14 million compared with 1960. As a result of reduced production, ex-vessel prices were at a considerably higher level than the previous year; and although the volume decreased 35 percent, the dockside value declined only 24 percent.

Brown shrimp (<u>Penaeus aztecus</u>) predominated the landings, accounting for 49 percent of the total; pink (<u>Penaeus duorarum</u>) 30; white (<u>Penaeus setiferus</u>) 18; and seabobs, (<u>Xiphopenaeus kroyeri</u>) 3 percent. Compared with the species composition of the 1960 landings, brown shrimp decreased 27 million pounds; white, 14 million; and pink, 2 million. There was little change in the size composition of landings compared with 1960. Shrimp with a count of up to 25 per pound, heads-off, accounted for 30 percent of the landings; 26-30 count, 14; 31-40 count, 25; and 41-and-over count, 31 percent.

Declines occurred in the catches in all areas from Pensacola, Florida, to the Mexican border, and also on the Sanibel-Tortugas grounds. The greatest decrease was in the Pensacola to Mississippi River area, where catches were 55 percent below those of 1960; Mississippi River to Texas border production declined 51 percent; waters off the Texas Coast, 45 percent; and the Sanibel-Tortugas grounds, 24 percent. The waters off the northwest Florida coast, Campeche Bank, and the high seas off the Mexican Coast west of 94° were the only areas in which catches exceeded those of the previous year. In the high seas fishery off Mexico west of 94° longitude, fishing effort increased 47 percent over 1960, yet the catch was up 120 percent. In the Apaluchicola area (Northwest Florida), fishing effort increased 30 percent, but catches were up only 2 percent. Fishing effort on the Campeche Bank increased 2 percent and resulted in a 1-percent increase in catches over those for 1960.

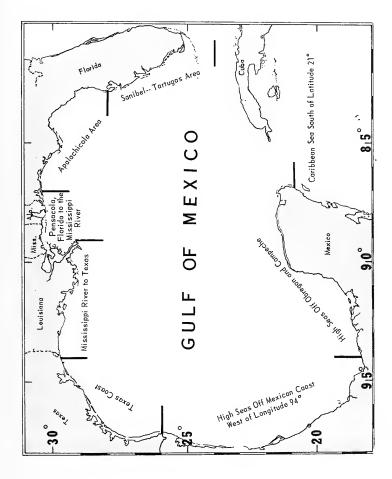

Information on the landings and catch of shrimp in the Gulf area, contained in the following tables, has been previously published in Current Fishery Statistics No. 2957. Monthly data on the landings and value of shrimp by variety and size for the South Atlantic States are included in Section 5 of this Digest.

## SUMMARY OF SHRIMP LANDINGS, 1961

| SIZE                | 81                                                                                                    | ROWN                                                                                                   | PI                                                                                                               | NK         | WHI                                              | TE                                                                                              | ТО                                                                                                      | TAL                                                            |

S. FISH AND WILDLIFE SERVICE, WASHINGTON 25, D. C.

## SECTION 7 - PACIFIC COAST FISHERIES 269

The yield of the commercial fisheries of the Pacific Coast States (Alaska, Washington, Oregon, and California) in 1961 amounted to 1.2 billion pounds valued at \$128 million. Landings were 122 million pounds and \$16 million larger than in 1960. Landings of bonito, jack mackerel, Pacific mackerel, salmon, tuna, king crab, shrimp, and squid were up substantially; while anchovies and halibut were up slightly. Catches of herring, rockfishes, sablefish, Pacific sardines, and Dungeness crabs were considerably smaller than in 1960.

The Pacific Coast accounted for 23 percent of the volume and 35 percent of the value of the total United States landings. It was second only to the Gulf Coastal States in quantity and led all other areas in value. California was first involume on the Pacific Coast with a catch of 598 million pounds (51 percent) valued at \$56 million (44 percent). Alaska (413 million pounds valued at \$46 million) was second with 35 percent of the volume and 36 percent of the value, followed by Washington, with landings of 120 million pounds valued at \$19 million. Oregon accounted for the remaining 51 million pounds and \$7 million.

There were 33,281 fishermen engaged in Pacific Coast fisheries in 1961. Fishing craft consisted of 4,740 vessels of 5 net tons and over, 11,977 motor boats, and 443 other boats. The fishing craft ranged from small one-man boats to a large tuna purse seiner of 701 gross tons.

Fish taken on the high seas off coasts of foreign countries by Pacific Coast fishermen amounted to 306.5 million pounds or 26 percent of the total catch. Tuna taken off Central and South America accounted for 23 percent of the total production. Other important species taken off foreign coasts were bottomfish, halibut, and salmon caught off British Columbia. In 1961, Pacific Coast fishermen ranged further than those of any other area in their search for fish, operating from the Bering Sea to waters off Peru.

There were 558 wholesale and manufacturing fishery firms operated in the Pacific Coast States during 1961--43 more than in the previous year. The firms gave employment to 24,855 persons -- a slight increase over 1960.

The value of processed fishery products on the Pacific Coast amounted to \$357 million in 1961--14 percent or \$44 million more than in 1960. California led all other Pacific Coast States with 51 percent of the total followed by Alaska, with 32 percent. Notable gains were registered in the production of fish fillets and steaks, canned fish and shellfish, and salted fish. Alaska showed the greatest percentage gain with the value of its processed products 32 percent greater than in the previous year, due primarily to increased packs of canned salmon, shrimp, and crabs. Washington was next with a 31 percent increase, principally the result of a larger pack of locally caught salmon and a substantial gain in the quantity of Alaska-caught fish canned in the State.

The total pack of canned fishery products in the four States amounted to over 20 million cases valued at \$300 million--about 320,000 cases and \$38 million above the 1960 production. Packs of salmon, mackerel, king and Dungeness crab meat, and shrimp were higher than in 1960. Canned sardines, clams, and tuna were produced in lesser quantities.

Despite an increase in the average price of meal from \$92 per ton in 1960 to \$106 in 1961, the total value declined 15 percent in 1961. This was caused principally by the reduced production of herring in Alaska, where, despite an extension of the season, production dropped considerably below the previous year's total.

The Pacific Coast tuna fishery improved somewhat over the previous year, due primarily to the greater number of purse seiners which entered the fishery in 1961. Landings increased to 311 million pounds from 288 million pounds in 1960. Catches of yellowfin, skipjack, and bluefin were higher, while the volume of albacore was less. About 88 percent of the catch of tuna was taken on the high seas in waters off Central and South America.

The Pacific tuna industry, stimulated by the success of converted seiners and the rapidly increasing consumption of canned tuna, continued to display spectacular economic progress in 1961. The California tuna fleet, changed by conversion from a predominantly clipper fleet fishing with hook and line, to a purse seine fleet fishing with huge nets, continued to take large quantities of yellowfin tuna. Research scientists took the position early in 1961 that this species was being overexploited--resulting in the purse seine fleet diverting some effort to fishing for skipjack. In 1961, the Inter-American Tropical Tuna Commission recommended that a catch limit be placed on yellowfin in order to maintain stocks at a level that would permit the maximum sustainable yield. The prices paid to fishermen increased four times during the year, and the prospects were for another raise as the year ended.

Albacore fishing off the coasts of Oregon and Washington fell off sharply in 1961, dropping from 5 million pounds in 1960 to less than 4 million pounds in 1961. The prices paid fishermen were considerably higher than in the previous year.

In California, the situation was the same. The albacore catch (29 million pounds) was 17 percent lower than that of 1960.

The albacore season began early, with catches running higher than the previous year. However, the fish, which usually move north as the season progresses, began their migration earlier than usual, and they apparently moved out to sea beyond the reach of many of the albacore boats.

Tuna canners also did well in 1961. There were few labor disputes or fleet tie-ups. The United States consumption of canned tuna, stimulated by intensive advertising and promotion, continued to grow, with apparent consumption reaching 2.1 pounds per capita. The 1961 United States pack of tuna reached a record 15.8 million standard cases valued at \$189.2 million. The tuna pack in the Pacific Coast States totaled 11.8 million standard cases valued at \$141.1 million, accounted for 75 percent of the volume and 75 percent of the value of the total domestic pack of these fish.

The 1961 Pacific salmon catch totaled 310 million pounds valued at \$52 million, which made this the most valuable species taken by U.S. fishermen in 1961. Shrimp had been the most valuable intem since 1951. The catch of salmon was favorable in nearly all sections of the Pacific Coast from Alaska to California. Alaska landings (265 million pounds) were the largest since 1956 and their value (\$36 million) was a record. In Washington, the catch was up 81 percent over the previous year. Oregon and California landings were also considerably above the 1960 level. The pack of canned salmon increased from 2.8 million cases in 1960 to 3.7 million cases in 1961. In Alaska, the pack was up 641,000 cases, while in Washington, Oregon, and California, it increased 221,600 cases.

The catch of red salmon in Western Alaska was the best since 1948, with the total run coming very close to the 22-million-fish estimate set by scientists of the Alaska Department of Fish and Game, the Fisheries Research Institute, and the Bureau of Commercial Fisheries. The size of the 1961 red salmon averaged 5.9 pounds in Western Alaska compared with 4.8 pounds in 1960.

Approximately 11.9 million red salmon were taken in Bristol Bay in 1961, with the Naknek-Kvichak fishery producing nearly 8.5 million and the Egegik, about 2.4 million fish. The balance came from the Ugashik, Nushagak, and Togiak fisheries. The industry was fully prepared to accommodate the expected large catches, and they were handled smoothly despite the large volume. The cold weather during the main run contributed to protecting the excellent quality of the big reds.

In Central Alaska, salmon fishing along the Alaska Peninsula and Kodiak Island was about the same as in the previous year. However, the completely unexpected run of pink salmon to Prince William Sound took the industry by surprise.

In Southeastern Alaska, the runs of pinks and chums in Icy Strait and adjacent waters were also somewhat of a surprise, both in the number of fish and the duration of the runs. Vessels converged on the scene as soon as the magnitude of the run became known. Scows spread the catch to distant canneries, making the operation more profitable.

The 1961 whaling season was the most successful since whaling was revived on the Pacific Coast in 1956. During the 1961 season, which extended from April 16 through October 15, a total of 343 whales was taken—72 more than in the previous year. Gains were registered in the number of blue, bottlenose, sei, and sperm whales, while fins and humpbacks were taken in fewer numbers than the previous year.

Fin whales, economically the most important species, were taken in larger numbers early in the season, while feed was abundant on the grounds, but disappeared early in August, thus reducing the season's take to 20 less than the previous year. Perhaps the most unusual feature was the appearance of large numbers of female sperm whales in the 1961 catch. The females of this species usually remain in warmer waters and are not often encountered in great numbers on the grounds fished by the Pacific fleet. However, several times during the year, the boats encountered harems containing a large number of females. Although most female sperm whales fall below the 35-foot legal size limit, sufficient numbers of larger females were found to boost the total take for this species to 88 more than were taken the previous year. The catch of these whales resulted in a large increase in the production of sperm oil.

The halibut fishery experienced a successful year despite a small decline in the total catch by Canadian and United States vessels, a situation that could have resulted from changes in the seasons rather than scarcity of fish or market conditions. United States fishermen took 53 million pounds (round weight basis) in 1961, compared with 51 million the previous year, and reversed a trend of the past few years in which Canadian fishermen had been increasing their percentage take each year.

At the Tokyo Conference of the International North Pacific Fisheries Commission, both the United States and Canada urged Japan not to fish otter trawls south and east of the Aleutian Islands and the Alaska Peninsula until the studies being made by the International Pacific Halibut Commission could be completed. The object of this research is to determine the effects of trawling on the stocks of halibut in these waters.

With the opening of the 1961 season, the Halibut Commission divided Area 3B into two sections--3B North and 3B South--each with a different opening date. Area 3B North was designated as that section north of the Aleutian Chain of the Alaska Peninsula, with an opening date of April 10. Area 3B South was designated as that portion of 3B south of the Aleution Chain of the Alaska Peninsula, with an opening date of April 25. Both areas closed on October 1--some two weeks earlier than in 1960.

These changes by the Halibut Commission were designed to shift fishing pressure from stocks that had been consistently fished for many years under the split season arrangement and to encourage fishing in the area north of the Alaska Peninsula. To compensate for this adjustment, the quotas were raised in some areas. There were no changes in rules for layup between halibut fishing trips in 1961, which provide for an 8-day layup between trips beginning at noon following arrival at port.

One of the more important developments in the 1961 fishery was the increase in landings in Prince Rupert, British Columbia, and at Ketchikan, Alaska, and a decline in landings at Seattle. The three top-ranking halibut ports in 1961 were Prince Rupert, British Columbia; Seattle, Washington; and Ketchikan, Alaska; in that order.

Although a price dispute threatened to delay the opening of the season, fishing began on time and continued throughout the season without interruption from labor or price difficulties.

Ex-vessel prices remained good throughout the season. This no doubt resulted from the landings being split among more ports, thus creating more competition. Even though landings were less, increased prices resulted in a gain of \$2.2 million for United States fishermen compared with the previous year.

The 1961 Pacific and jack mackerel catch of 141.7 million pounds was 27 percent greater than in the previous year, and the best since 1957. During most of the year, jack mackerel were so abundant in southern California waters that canners set nightly limits of from 20 to 40 tons per vessel for virtually the entire season. Landings would doubtlessly have been much higher had it not been for these limits.

Shrimp production took a phenomenal jump in 1961, with a 68-percent increase over 1960. Alaska and Oregon registered large increases—more than doubling the 1960 total. Prices, however, did not keep pace, except in Alaska, and the total value of this fishery was only 41 percent above the previous year's total. Despite a slight decline in the California catch, a new record per hour of fishing was established in that fishery.

Chiefly responsible for the increase in the Pacific shrimp catch was the failure of the Gulf of Mexico shrimp fishery, resulting in the inability of the industry to adequately supply the demand, even with the increased imports. Canned shrimp production established a record for the Pacific area with a pack of nearly 139,000 standard cases—over 59,500 standard cases more than in 1960. Another important development contributed to the improvement of the Pacific Coast shrimp industry; namely, the development of shrimp logs for use by the breading industry. As a result of reduced supplies from usual sources, a breading firm developed the logs, and by the end of the year had marketed considerable quantities.

King crab production established a record in 1961, both in total landings and in the canned pack. The catch was not made without sacrifices, as 9 craft and 13 fishermen were lost. What may have been a record trip of king crabs was landed by the vessel Nautilus at Port Wakefield, Alaska, when the vessel landed 10,000 crabs in December. Landings of Dungeness crabs declined over the entire range, and prices increased considerably in most areas. Canners found themselves outbid for live crabs as the fresh market absorbed most of the catch.

Oyster production dropped nearly 1 million pounds (8 percent) below the 1960 total. The principal cause of the decline was believed to be the curtailed demand by the canning industry, caused by imports of lower priced canned Japanese oysters. In an effort to stay in the highly competitive market, canners produced oyster stew in greater quantity than in any year except 1960.

The Bureau acknowledges the assistance of the following organizations in the collection of the data appearing in this section: The Washington Department of Fisheries, the Oregon Fish Commission, the California Department of Fish and Game, and the Alaska Department of Fish and Game.

Condensed summary data on the operating units and catch by States for the Pacific Coast fisheries appearing on the following pages have been previously published in Current Fishery Statistics No. 3122. Additional data on many aspects of the Pacific Coast fisheries appear in daily, monthly, and annual reports published by the Bureau's Fishery Market News Service offices in San Pedro, California and Seattle, Washington. Specific data on several of the major fisheries of the Pacific Coast may be found in Section 12 of this publication.

<sup>1/</sup> INCLUDES THE VALUE OF HALIBUT LIVERS AND VISCERA AMOUNTING TO \$9,810. 2/ INCLUDES LINGCOD.

<sup>2/</sup> INCLUDES LINECUDE.
3/ ESTIMATED WEIGHTS OF SALMON WERE DETERMINED FOR EACH REGION. THESE WEIGHTS WERE USED TO CONVERT NUMBER OF SALMON TO POUNDS.
5ALMON TO POUNDS.

<sup>4/</sup> THE WEIGHT OF CLAMS REPRESENTS THE WEIGHT OF MEATS BASED ON A YIELD OF 25.5 PERCENT FOR COCKLE AND 42 PERCENT FOR RAZOR CLAMS.

FUR RALUK CLAMS.
NOTE:--THE ABOVE DATA INCLUDE CATCHES OF HALIBUT, SABLEFISH, LINGCOD, AND ROCKFISHES LANDED BY VESSELS OF U. S.
NOTE:--THE ABOVE DATA INCLUDE CATCHES OF HALIBUT, SABLEFISH, LINGCOD, AND ROCKFISHES LANDED BY WULTIPLYING
REGISTRY IN BRITISH COLUMBIA PORTS. ROUND WEIGHTS OF FISH TAKEN BY HALIBUT TYPESELS WERE OBTAINED BY MULTIPLYING
REPORTED WEIGHTS, REPRESENTING POUNDAGE OF FISH EVISCERATED AND WITH HEADS-OFF, BY THE FOLLOWING FACTORS:
HALIBUT 1.33, SABLEFISH AND ROCKFISHES 1.43.

#### LANDINGS BY HALIBUT FLEET AT SEATTLE, WASHINGTON

Landings of halibut at Seattle, Washington in 1961 by the United Stateshalibut fleet amounted to 12.6 million pounds valued at \$3 million. This was 3.1 million pounds or 20 percent less than in 1960, but an increase of \$75,000, or nearly 3 percent. In 1961, ex-vessel halibut prices at Seattle reached the highest level since 1958.

Landings of halibut from fishing grounds west of Cape Spencer decreased 2.4 million pounds compared with 1960. Sablefish landings from grounds south of Cape Spencer amounted to 1.4 million pounds--1.3 million pounds less than in the previous year.

The following tables contain a summary of the landings of dressed halibut at Seattle by the United States halibut fleet. These data are not directly comparable with the State and sectional tabulations, since the weights in those tables represent the round weight of fish landed.

AREA 3A CLOSED TO HALIBUT FISHING ON AUGUST 23. AREAS 2 AND 1B CLOSED TO HALIBUT FISHING ON SEPTEMBER 7. AREAS 1A AND 3B CLOSED TO HALIBUT FISHING ON OCTOBER 1. ALL AREAS OPENED OR CLOSED AT 6 A.M. PACIFIC STANDARD TIME.

#### WHALING

During the 1961 season, two companies again carried on whaling operations from shore stations located on Point San Pablo, Richmond, California. A third company began whaling from a shore station at the mouth of the Columbia River. The two stations in California used the same five catcher boats operated in previous years, while the Oregon company used only one catcher boat. The season was the same as in 1960--April 16 through October 15.

The total catch of 343 whales, 72 more than in 1960, made the season the most successful since whaling resumed on the Pacific Coast of the United States in 1956. The catch was processed into 3 million pounds of whale meat and 3.5 million pounds of sperm oil, whale oil, and condensed solubles. These products were valued at \$847,000 to the producers. Compared with 1960, this represented a gain of 15 percent in volume and 26 percent in value. One factor responsible for the gain was the much higher catch of sperm whales—104 compared with only 16 in 1960. In previous years, the catcher vessels largely neglected sperm whales because of the relative undesirability of the meat, and the low prices paid for the oil. However, with sperm oil prices up in 1961, and the whales more numerous than usual, catcher boats spent more time in pursuit of this species.

An unusual feature of the 1961 season was the large proportion of female sperm whales in the catch; previously only two females had been taken, both in 1960. Female sperms usually remain in warmer waters, and are infrequently encountered off the west coast above latitude 35° north. However, several times during the season the boats encountered harem schools containing up to 50 sperm whales, mostly females. Although most females fall below the 35-foot legal size limit, enough larger ones were encountered to bring the female catch to 43.

Many fin whales, economically the most important species, were taken early in the season when their euphausiid feed was abundant, but they disappeared from the area in early August, and the total catch of 118 fin whales was considerably below the 138 taken in 1960. Humpback whales, which have been seriously depleted locally, showed a further decline in catch. The catch of sei whales continues to increase as the larger species of baleen whales become less available. Blue whales rarely occur in any numbers in central California waters, and then only in late September and October. Only two were taken.

#### FUR SEAL INDUSTRY OF THE PRIBILOF ISLANDS

A total of 95,974 sealskins was harvested on the Pribilof Islands in 1961—the third largest production in this century. Only in 1943 (117,184 skins) and in 1956 (122,826 skins) was the yield greater. During the season (July 2 to August 15),82,099 male and 13,875 female skins were taken, compared with 36,320 male and 4,296 female skins during the 1960 season. Not included in these totals were rejected skins or those used for research purposes. The near-record yield in 1961, derived mostly from the 1957 and 1958 year classes, resulted from three principal factors:

- (1) An unusual abundance of 3-year-olds, which made up 70 percent of the seasonal total instead of the normal 60 percent.
- (2) The long season of 45 days, 10 days more than the long-term average. Although it had been anticipated that deliberate killing of males would end on August 5 or 10, 3-year-old bachelors continued in such good supply, size, and quality that they were utilized until August 15. The accumulated 53,000-kill of both sexes through July was better than in any year since 1956. The seasonal peak of bachelor abundance, which formerly occurred within the last 10 days of July, has been trending later in recent years.
- (3) The upper limit of the killable length range was raised this year from 45.75 inches to 47.75 inches. This contributed 7,000 additional males to the total. In 1960, less than 2,000 bachelors 46 inches and over were taken.

To carry out the objective of generally reducing the overall size of the herd as agreed at the Fourth International Fur Seal Commission meeting at Tokyo last February, cow-kill quotas for 1961 were set at 35,000 for St. Paul and 8,750 for St. George. An effort was made to take as many as possible of the females appearing in the regular drives; totals reached 10,495 and 3,623 killed on the respective islands by August 15. The remaining females in the quota were killed after the supply ship left on August 28 when manpower could be released from loading operations. The program was completed on September 7 at St. George and on September 14 at St. Paul, with total female kills for the season of 8,763 and 35,082 respectively, 5,140 and 24,587 of which were taken after the regular season. Because the fur is in moulting condition (stagey) so late in the season, the pelts were not salvaged.

The large kill in 1961 offered nothreat to the seal resource. An ample breeding reserve of males was assured by escapement of a portion of the two important age groups during and after the season.

NOTE: --AGE WAS DETERMINED BY COUNTING GROWTH RIDGES ON CANINE TEETH OF A 10 PERCENT SAMPLE OF KILLED ANIMALS. MEASUREMENTS ARE OVERALL LENGTHS TAKEN ON THE KILLING FIELD.

#### DISTRIBUTION OF TAKE OF SEALSKINS, 1961

The fur seal treaty specifies that Canada and Japan are to receive 15 percent each of the skins taken on the PribilofIslands. To ensure an impartial selection of their respective 15 percent, Canada made a random choice of numbers 6, 14, and 20; and Japan 3, 5, and 7 out of each 20 barrels of sealskins. This resulted in the following allocation of skins to the United States, Canada, and Japan:

| ITEM                               | UNITEO<br>STATES | CANADA          | JAPAN           | TOTAL            |
|------------------------------------|------------------|-----------------|-----------------|------------------|

NOTE, -- DOES NOT INCLUDE 220 SKINS REJECTED DURING PROCESSING, 117 FEMALE SKINS FOR RESEARCH PURPOSES, 1 SKIN REJECTED ON THE FIELD, AND 3 SKINS MISCOUNTED AND NOT LOCATED.

#### PACIFIC COAST FISHERIES

#### SALE OF SEALSKINS, 1961

Two public and one special sealskin auction were held in St. Louis, Missouri, in 1961. A total of 62,706 skins was sold for the account of the United States Government. Gross receipts from the three auctions yielded \$4,183,403. The offerings consisted of 44,234 conventionally processed skins which yielded \$3,860,634 and 18,472 sheared skins which sold for \$322,769. The latter were the first sheared "Lakoda" skins offered for sale. The average price of \$21.06 per skin was far below the \$87.28 received for conventionally processed skins. An additional three sheared "Lakoda" skins were sold at private sales for promotional purposes. These yielded \$67.50.

A SMALL FAMILY OF FUR SEALS

#### PRODUCTION OF FUR SEAL MEAL AND OIL, 1961

The operation of the fur seal industrial products reduction plant on St. Paul Island was terminated on August 16. A total of 45,772 carcasses was processed into meal and oil. In 1961, production of industrial products amounted to 312 tons of meal and 52,458 gallons of oil.

| NETL | UNIT    | QUANTITY | VALUE    |
|------|---------|----------|----------|
| MEAL | TONS    | 312      | \$24,130 |
|      | GALLONS | 52,458   | 14,619   |

The combined United States and Canadian commercial fish catch from the waters of the Great Lakes (113.4 million pounds) and the International Lakes of northern Minnesota (6.9 million pounds) was over 10 million pounds or 9 percent greater than in 1960. The catch in the Great Lakes was up 8.7 million pounds, and in the International Lakes, 1.5 million pounds. United States fishermen accounted for 59 percent of the landings. The Canadian catch increased from 42 million pounds in 1960 to 50 million pounds in 1961, while United States landings increased from 68 million to 71 million pounds. The Canadian catch of yellow perch from Lake Erie (17 million pounds) was 48 percent larger than in the previous year and accounted for most of the increased United States-Canadian landings. Alewives and tullibee were also landed in larger volume while other important species were taken in about the same volume as in 1960.

United States fishermen took 70.6 million pounds of fish valued at \$7 million in 1961. Landings were 2.4 million pounds or 4 percent larger than in 1960, although the value of the catch was \$162,000 or 2 percent less. Catches of alewives, carp, lake herring, and sheepshead were slightly above those taken in 1960; while smaller quantities of smelt, yellow perch, and yellow pike were taken.

Lake Michigan led all the other lakes in production with 25.6 million pounds or 36 percent of the total United States catch. Lake Erie was second (19.6 million pounds), followed by Lake Superior (14.7 million pounds). Lake Ontario, Lake Huron, and the International Lakes accounted for the remaining 10.7 million pounds.

Among the eight Great Lakes States, Michigan continued to lead in production with 24.5 million pounds. Wisconsin was in second place with 21.9 million pounds, followed by Ohio, 15.8 million pounds. These three States accounted for 88 percent of the volume and 91 percent of the value of the 1961 catch.

In 1961, a total of 3,773 men, 469 vessels of 5 net tons and over, and 1,480 other craft was employed in the commercial fisheries of this area. The number of vessels fishing was less than in the previous year. As a result of the poor economic condition of the Great Lakes fisheries for a number of years, there has been a steady decline in the number of vessels operated on the lakes. Since 1950, the number has dropped from 661 to 469—a decrease of 192 or 29 percent.

The sea lamprey invasion into the Great Lakes in the 1930's caused a drastic change in the abundance of fish. After decimating stocks of lake trout, the lamprey attacked whitefish and other species. Accompanying the decline in the abundance of lake trout and whitefish was a great increase in the number of fish, such as chubs and alewives, which formerly were preyed upon by the lake trout and whitefish.

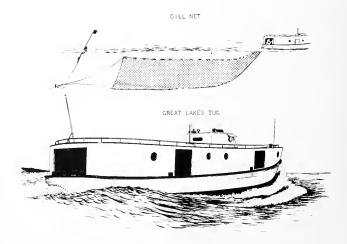

Bureau efforts in the Great Lakes have been concentrated on bringing the sea lamprey under control, restoring lake trout stocks, and developing methods for capturing and utilizing supplies of presently abundant species.

Under the auspices of the International Great Lakes Fishery Commission, the U.S. Bureau of Commercial Fisheries and the Fisheries Research Board of Canada treated, with a selective toxicant, all tributary streams of Lake Superior known to contain larval sea lampreys. The project, started in 1958, represents a major accomplishment in the field of chemical control of an undesirable species. Success in controlling the sea lamprey in Lake Superior has brought renewed hope for other lakes where valuable stocks of commercial species have become virtually extinct. Artificially propagated lake trout are being used to restock Lake Superior. Survival of hatchery-planted trout has been excellent and growth rapid, indicating a promising future for rehabilitating the fishery.

Late in 1961, the Bureau's new research vessel <u>Kaho</u>, especially designed for exploratory fishing and gear research activities, joined the biological research vessel <u>Cisco</u> that has been used in fishery and environmental studies to learn more about factors that influence the abundance, growth, distribution, and movements of commercially important fish. The biological and exploratory fishing activities are part of an integrated Bureau program which also includes studies in processing, marketing, economics, and statistics of commercial fish. The object of this program is to develop optimum utilization of the commercial fishery resources of the Great Lakes.

Much of the data in this section was assembled and prepared for publication by the Bureau's Branch of Statistics and Branch of Inland Fisheries from information collected by the following agencies: Dominion Bureau of Statistics of Canada; Illinois Department of Conservation; Indiana Department of Conservation, Division of Fish and Game; Michigan Department of Conservation; Minnesota Department of Conservation; New York Conservation Department, Division of Fish and Game; Ohio Department of Natural Resources, Division of Wildlife, Section of Fish Management; Pennsylvania Fish Commission; and Wisconsin Conservation Department.

Condensed summary data on the operating units and catch of the Great Lakes fisheries appearing on the following pages have previously been published in Current Fishery Statistics No. 3183. Seasonal variations in the catch of fish landed in Minnesota, Wisconsin, Michigan, and Ohio can be ascertained from monthly landing bulletins issued currently in cooperation with the fishery departments of those States. Additional specific data on many aspects of the Great Lakes fisheries may be found in the daily, monthly, and annual reports published by the Bureau's Chicago Fishery Market News Office.

<sup>1/</sup> LESS THAN 50 POUNDS OR 50 CENTS.

<sup>2/</sup> THE POUNDAGE AND VALUE OF THE CATCH OF CHUBS BY OTTER TRAWLS IN THE MICHIGAN AND WISCONSIN WATERS OF LAKE MICHIGAN INCLUDE 5,755,000 POUNDS, VALUED AT \$170,274 TAKEN FOR ANIMAL FOOD.

## SECTION 9 - MISSISSIPPI RIVER FISHERIES

Due to budgetary limitations, it was not possible to conduct a complete general canvass of the Mississippi River and its tributaries for 1961 data. The most recent complete survey of catch and operating unit data is for 1960. Surveys of the volume and value of the catch were conducted for the following States in 1961: Alabama, Illinois, Iowa, Louisiana, Minnesota, Montana, Tennessee, Wisconsin, and Wyoming. For the remainder of the States, 1960 data have been used. States for which 1960 figures are shown are Arkansas, Indiana, Kansas, Kentucky, Mississippi, Missouri, Nebraska, North Dakota, Oklahoma, South Dakota, and Texas. All operating unit data appearing in this Section are for the year 1960.

Wisconsin was the only State in which a 1961 survey was made that showed a gain in catch over the previous year. In all other States the catch declined.

The Bureau acknowledges the assistance of the following organizations in the collection of data appearing in this section: Alabama Department of Conservation, Division of Game and Fish, Arkansas Game and Fish Commission; Illinois Department of Conservation; Indiana Department of Conservation; Indiana Department of Conservation; Iowa State Conservation Commission; Kansas Forestry, Fish and Game Commission; Kentucky Department of Fish and Wildlife Resources; Louisiana Wild Life and Fisheries Commission; Missouri State Conservation Commission; Montana State Fish and Game Commission; Nebraska Game, Forestation, and Parks Commission; North Dakota State Game and Fish Department; Oklahoma Game and Fish Department; South Dakota Department of Game, Fish and Parks; Tennessee Game and Fish Commission; Texas Game and Fish Commission; Wisconsin Conservation Department; Wyoming Game and Fish Commission; and the Tennessee Valley Authority, Fish and Game Branch.

#### WYOMING

THE COMMERCIAL FISHERIES OF WYOMING, IN THE TRIBUTARIES OF THE MISSISSIPPI RIVER, ARE CONFINED TO THE INLAND LAKES AND STREAMS. THE CATCH CONSISTEO OF 377,600 POUNDS OF CARP, VALUED AT \$11,329

The 1961 landings of commercially caught fish and shellfish at ports in the State of Hawaii amounted to 14.5 million pounds valued at nearly \$3 million to the fishermen. This was a gain of 3.4 million pounds (30 percent) and \$193,000 (7 percent) compared with 1960. Landings of skip-jack tuna which totaled 11 million pounds (up 3.6 million pounds) accounted for most of the increase. The gain fulfilled predictions made by the Bureau's Biological Laboratory at Honolulu of a better than average year for skipjack landings. In 1961, the catch of skipjack averaged 6,000 pounds per trip—the fourth highest average catch per trip since 1952.

Following skipjack in importance of volume and value of the catch was the longline fishery for bigeye and yellowfin tuna, and black and striped marlin. The downward trend of the longline fishery since 1953 has been caused chiefly by reduced catches of bigeye tuna. Landings of this species have declined from a high of 2.8 million pounds in 1953 to 1 million pounds in 1961. The fishery for yellowfin tuna, and black and striped marlin has remained relatively stable. The longline fishery is conducted by approximately 30 vessels of 5 net tons or more, which fished from 20 to 30 baskets of 6-hook gear. Bait used with this gear consisted largely of imported jack mackerel which have replaced imported sardines. Since the vessels have no mechanical refrigeration, ice is used to preserve the catch. Usually 1 or 2 weeks of fishing are required before the vessels catch a full cargo.

Fishery products were landed at six of the eight islands that form the State of Hawaii. The Island of Oahu ranked first with a catch of 11 million pounds (76 percent). The Island of Hawaii was in second place with 1.9 million pounds, followed by Maui (1.3 million pounds). The remainder of the catch was landed at ports on the Islands of Kauai, Molokai, and Lanai. Receipts of tuna (albacore, bigeye and bluefin, little, skipjack, and yellowfin) accounted for 86 percent of the quantity and 69 percent of the value of all fishery products landed in Hawaii. The 1961 catch was taken by 589 fishermen. Fishing craft operated during the year included 65 vessels of 5 net tons and over, 195 motor boats, and 20 other boats. Except for minor improvements in craft and gear, the fishermen of Hawaii still fish much as they did 40 years ago.

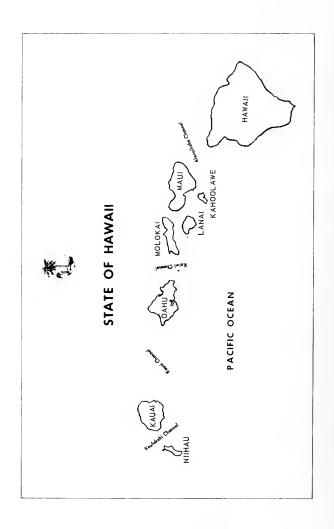

Data on the volume and value of the fisheries of Hawaii, by months, were published in Statistical Digests for the years 1946-58. It was not until 1959, the year Hawaii became a State, that operating unit and catch data were assembled in approximately the same manner as those for other States so that the figures could be included in the national summary tables. Catch data for Hawaii are presented in two categories—the ocean catch and the pond (salt-water) catch. The common and scientific names of the species of fish and shellfish landed in Hawaii are not included in Section 14 of this report.

The data in this section were assembled and prepared for publication by the Bureau's area office, Honolulu, Hawaii, largely from information collected by the Hawaii Department of Land and Natural Resources, Division of Fish and Game.

The following tables contain summarized and detailed information on the 1961 operating units and catch by islands of the State of Hawaii. Condensed summary data on the operating units and catch of the Hawaii area, appearing in the following pages, have been previously published in Current Fishery Statistics No. 3128.

## SECTION 11

## REVIEW OF CERTAIN MAJOR FISHERIES

There are presented in this Section of the Digest complete data on the catch of certain major species of fish and shellfish taken on a commercial scale in the United States. Additional information is presented on the operating units engaged in the menhaden purse seine, salmon troll, the shrimp and fish otter trawl, and the tuna fisheries. Although the data on catch are included in the detailed catch tables of the various States, they have been repeated in individual fishery tables in this portion of the report to provide readers with a single source of catch data for cod, haddock, halibut, Pacific mackerel, jack mackerel, menhaden, Atlantic ocean perch, Pacific sardines, salmon, tuna, oysters, clams, crabs, and shrimp. Most of the above species are taken by several types of fishing gear. Because of this, the casual reader of the Digest often experiences difficulty in locating complete data on the catch of the species in individual State catch tables. The information contained in this Section includes the volume and value of the catch by individual types of gear and by States and districts.

#### UNITED STATES COD FISHERY

In 1961, United States fishermen landed 49.7 million pounds of cod valued at \$3 million. This was an increase of 3.9 million pounds (9 percent) and \$186,000 (6 percent) compared with the catch of the previous year.

Otter trawls accounted for 81 percent of the catch; lines of all types, 14 percent; and gill nets, 5 percent. The remaining catch was taken in pound nets, floating traps, pots and traps, and dredges.

Landings at Massachusetts ports, amounting to 38 million pounds, accounted for 77 percent of the total catch. Washington was second with 3 million pounds, followed by Maine, 2.5 million pounds; and New Jersey, 2.4 million pounds. The remaining catch was landed in 8 other Atlantic and Pacific Coast States.

#### SUMMARY OF COD CATCH, 1961

(THOUSANDS OF POUNDS AND THOUSANDS OF DOLLARS)

GILL NETS

## ATLANTIC COAST HADDOCK FISHERY

The 1961 commercial catch of haddock totaled 133.6 million pounds valued at \$10 million. This was an increase of almost 15 million pounds or 13 percent and  $$509,000 \, \text{or} 5$$  percent compared with 1960. The average price paid for haddock declined slightly from 7.9 cents per pound in 1960 to 7.4 cents in 1961.

Landings of haddock at Massachusetts ports (130.5 million pounds) were the largest since 1956 and accounted for 98 percent of the 1961 United States catch of this species. The catch by otter trawls comprised 98 percent of the total haddock production. The remaining 2 percent was taken with gill nets and lines.

About 85 percent of the catch was taken from waters off New England--principally in the Georges Bank and South Channel areas. Waters off Nova Scotia accounted for about 15 percent.

#### PACIFIC COAST HALIBUT FISHERY

The halibut fishery of the United States and Canada in the Northwest Pacific Ocean and Bering Sea is managed by the International Pacific Halibut Commission. Under regulation, the fishery, which had declined to an unprofitable state, has been restored to a highly profitable condition.

The total catch in 1961 by United States and Canadian fishermen amounted to 69.5 million pounds (dressed weight). The catch was approximately 2.4 million pounds less than the record 72 million pounds taken in 1960. Contributing to the decline was the elimination of the second fishing season in area 2. This short postseason in area 2 usually yields about half the amount of the 1961 decline. United States fishermen accounted for 40 million pounds or 58 percent of the 1961 total production. Canadian fishermen, reversing a recent growth trend, were not so successful as in the previous year when they accounted for 47 percent of the catch.

In 1961, the former Area 3B was divided into north and south sections both without catch limit restrictions. Area 3B (north) opened April 10 while Area 3B (south) opened April 25. All other areas opened on May 10. Area 3A closed to halibut fishing on August 23, followed by Areas 2 and 1B on September 7, and Areas 1A and 3B on October 1.

Data on the landings of halibut in the following tables represent the dressed weight of fish, i.e., the weight by which the quota is determined. The dressed weight of halibut can be converted to round weight by multiplying by 1.33. Halibut landed in Canada by vessels of United States registry is credited to Alaska.

MOTE:—HALIBUT STATISTICS IN THESE TABLES WERE COMPILED FROM DATA COLLECTED BY THE INTERNATIONAL PACIFIC HALIBUT COMMISSION. STATISTICS FOR OTHER SPECIES WERE FURNISHED BY THE STATES.

#### ATLANTIC OCEAN PERCH FISHERY

The catch of Atlantic ocean perch in 1961 totaled 132 million pounds valued at \$5 million. This was a decrease of 9.4 million pounds and \$306,000 (down 7 percent in volume and 6 percent in value compared with 1960) and the lowest catch since 1945.

Except for a negligible amount taken with longlines, the fish were captured by Maine and Massachusetts otter trawlers. The Maine production accounted for 77.4 million pounds and \$2.9 million--59 percent and 58 percent, respectively, of the total volume and value of the ocean perch catch.

Ocean perch were caught in greatest volume on the Nova Scotia banks, which yielded 63.8 million pounds or 48 percent of the entire catch. The Grand Bank was next with 36.8 million pounds or 28 percent. The remainder of the catch was taken off the New England Coast or in the Gulf of St. Lawrence.

The ocean perch fishery reached its height in 1951 when 258 million pounds were taken. The following year marked the launching of the last new vessel to enter the ocean perch fleet. Since that year there has been a gradual decline in the size of the fleet and the catch. This downward rend has developed chiefly because of low prices, scarcity of ocean perch in areas readily available to smaller craft, and fewer vessels capable of reaching distant fishing grounds.

#### PACIFIC COAST SALMON FISHERY

The 1961 commercial salmon catch in the Pacific Coast States totaled 310 million pounds valued at \$52 million—an increase of 75 million pounds and \$7 million over the previous year. The Alaska catch (265 million pounds valued at \$36 million) was up 28 percent in volume and 7 percent in value. Washington landings of 30 million pounds increased 13 million pounds or 81 percent, while the value (\$9 million) was up 59 percent over 1960. In both Oregon (7 million pounds) and California (9 million pounds), production was about 2 million pounds over the previous year.

The catch of red salmon in Western Alaska was the best since 1948, with the total run amounting to nearly 22 million fish. Red salmon averaged 5.9 pounds per fish in Western Alaska compared with 4.8 pounds in 1960. Purse seines were the most important gear used in taking salmon, accounting for 147 million pounds (47 percent) of the total catch. Gill nets were second with nearly 130 million pounds (42 percent). The remaining 11 percent was taken by lines, floating traps, haul seines, reef nets, pound nets, dip nets, and wheels.

#### PACIFIC COAST SARDINE FISHERY

The scant 43 million pounds of sardines taken during 1961 was a marked decline from the 58 million pounds in 1960 and the average of nearly 109 million pounds during the previous decade. Sardines failed to appear in appreciable quantities throughout the year; and in addition, rough weather, heavy rain, and fog hampered operations through the late fall and winter.

Few straight catches of sardines were made, and most landings consisted of trips with 30-40 percent sardines and 60-70 percent mackerel.

The entire sardine catch was taken with purse seines and lampara nets. The San Pedro district accounted for 77 percent of the landings and the Santa Barbara, 20 percent. The remaining 3 percent was taken in the Monterey and San Diego districts.

In June 1961, the State of California enacted legislation extending the 1961 and 1962 sardine fishing seasons 2 months to permit taking sardines during January and February of 1962 and 1963.

#### PACIFIC MACKEREL FISHERIES

The 1961 catch of jack mackerel (97.8 million pounds) was up 22.7 million pounds compared with 1960. Landings of Pacific mackerel (44 million pounds) were 7 million pounds greater than in the previous year. The combined mackerel catch amounted to 142 million pounds valued at \$3 million-an increase of 30 million pounds and \$644,000 over 1960. As in previous years, most of the catch of jack mackerel (81 percent) and Pacific mackerel (94 percent) was landed in the San Pedro district.

Nearly all of the jack mackerel and 93.4 percent of the Pacific mackerel were taken by purse seines and lampara nets. Brail or scoop nets accounted for 6.5 percent of the Pacific mackerel catch.

#### SUMMARY OF JACK MACKEREL CATCH, 1961

(THOUSANDS OF POUNDS AND THOUSANDS OF DOLLARS)

#### PACIFIC TUNA FISHERY

The 1961 domestic catch of tuna landed at Pacific Coast and Hawaii ports totaled 323.4 million pounds valued at \$42.2 million. Compared with the previous year, this was an increase of 26.6 million pounds and \$4.7 million. Landings at ports in continental United States increased from 287.8 million pounds in 1960 to 311 million pounds in 1961, largely as a result of gains in skipjack landings. In Hawaii, the catch of 12.4 million pounds was 38 percent over the 1960 landings, also due to greater skipjack receipts.

Conversion of clippers to purse seine vessels continued at a steady pace, and there was a trend toward use of larger seiners. The catch by purse seiners totaled a record 234.3 million pounds—60.2 million pounds more than in 1960. As a result of the conversion of clippers to seiners, the catch by lines amounted to only 89,1 million pounds—33.5 million pounds less than in 1960 and 246.5 million pounds under the record 335.6 million pounds taken by lines in 1950.

Yellowfin catches began to decline rapidly after May 1961, following a pattern predicted by scientists of the Inter-American Tropical Tuna Commission. California yellowfin landings during the first 5 months of 1961 were 27.5 million pounds more than in the same period in 1960. However, in the last 7 months of the year, they were 24.7 million pounds less. At a special meeting in Long Beachin September 1961, the Commission recommended the establishment of a yellowfin catch quota for the eastern Pacific.

A total of 4,535 fishermen, 1,027 vessels, and 493 motor boats engaged in the tuna fishery in 1961.

<sup>1/</sup> INCLUDES THE CATCH OF BIGEYE TUNA. 2/ LESS THAN \$500.

## UNITED STATES MENHADEN FISHERY

The 1961 menhaden catch amounted to 2.3 million pounds—45 percent of the total United States production of all species. The catch was 296 million pounds greater than in 1960 and 112 million pounds above the previous high reached in 1959.

The Gulf catch, which totaled over 1 billion pounds for the first time, was 180 million pounds above the previous year's production. Along the Atlantic Coast, the take was 117 million pounds greater than in 1960.

Purse seines accounted for 98 percent of the 1961 catch. The remainder was taken by pound nets, haul seines, gill nets, fyke and hoop nets, floating traps, trammel nets, and otter trawls.

Of the total, 44 percent was landed in the Gulf of Mexico, 31 percent in the Middle Atlantic, 13 percent in the Chesapeake, 11 percent in the South Atlantic, and 1 percent in the New England area.

There is included in this Section a detailed summary of operating units engaged in the Atlantic and Gulf Coast menhaden purse seine fishery. During 1961, a total of 3,495 fishermen, 180 vessels, 466 motor boats, and 43 other boats was engaged in the menhaden fishery.

<sup>1/</sup> LESS THAN 500 POUNDS OR \$500.

## UNITED STATES CLAM FISHERY

The 1961 yield of the United States clam fishery amounted to 50 million pounds of meats valued at \$11.7 million to the fishermen. This was a gain of 2 percent in volume, but a decrease of 3 percent in value compared with the previous year. The Middle Atlantic led all other areas in the production of clam meats with 68 percent of the total. The New England and Chesapeake States accounted for 15 and 14 percent, respectively. The remaining 3 percent was produced in the South Atlantic, Gulf, and Pacific Coast areas.

Clam dredges took 36 million pounds (72 percent) of clam meats; tongs, 5.7 million pounds (11 percent); and rakes, 3.9 million pounds (8 percent). The remainder of the catch was taken with hoes, forks, shovels, or gathered by hand.

In Section 13 of this Digest, under the heading "Conversion Factors," there is a table which gives the average State yield per United States standard bushel for the clams taken on the Atlantic and Gulf Coasts. Supplementary shellfish tables appear after the summary tables for each Atlantic and Gulf regional section.

#### UNITED STATES CRAB FISHERY

The 1961 catch of crabs in the United States amounted to 231.6 million pounds, valued at \$17.3 million. Compared with the 1960 catch, this was an increase of 10 million pounds and \$269,000.

The Pacific States led all other areas with 76.3 million pounds (33 percent) of the catch and \$8.9 million (51 percent) of the total value for these crustaceans.

The king crab fishery again experienced a phenomenal growth as landings increased to 43.4 million pounds from 28.6 million pounds the previous year.

The catch of blue crabs (152.8 million pounds) was 1.9 million pounds less than in 1960, while landings of Dungeness crabs (32.7 million pounds) were down 3.5 million pounds.

In Section 13, under the heading "Conversion Factors," is a table which gives the average number of crabs per pound by species for each of the Atlantic and Gulf States. Supplementary shellfish tables are shown after the summary tables for each Atlantic and Gulf regional Section.

DUNGENESS CRAB POT

## UNITED STATES OYSTER FISHERY

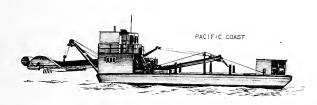

The 1961 yield of the United States oyster fishery totaled 62.3 million pounds of meats valued at \$33.2 million. Compared with 1960, this was a gain of 2.3 million pounds (4 percent) and \$4 million (14 percent). The increased quantity resulted chiefly from a rise of 2.1 million pounds in oysters taken in the Gulf States. Small gains in the Middle Atlantic and Chesapeake States were offset by decreases along the Pacific Coast.

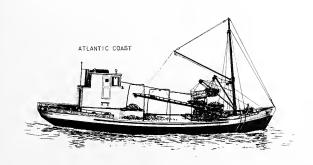

The Chesapeake Bay area led in the production of oyster meats with a yield of 27.5 million pounds--44 percent of the 1961 catch. The Gulf States were in second place with a catch of 18.2 million pounds (29 percent), followed by the Pacific area with 10.2 million pounds (16 percent). The New England, Middle Atlantic, and South Atlantic States accounted for the remainder.

Dredges were used to take  $42.4 \, \text{million}$  pounds (68 percent) of the oyster harvest while tongs (16.5 million pounds) accounted for 26 percent. The remainder of the catch was taken with grabs, rakes, forks, or gathered by hand.

In Section 13 of this Digest is a table which gives the volume of the bushel measures used for oysters in the various Atlantic and Gulf States and the average yield per bushel. Supplementary shellfish tables appear after the summary tables for each Atlantic and Gulf regional section.

<sup>1/</sup> EASTERN, PRIVATE, INCLUDES 14,800 POUNDS OF OYSTERS, VALUED AT \$5,110 HARVESTED IN CALIFORNIA.

### UNITED STATES SHRIMP FISHERY

The 1961 catch of shrimp in the United States totaled 174.5 million pounds valued at \$51.7 million. Compared with 1960, this was a decrease of 74.9 million pounds (30 percent) and \$15.2 million (23 percent). Landings in the South Atlantic area (19.7 million pounds) decreased 37 percent and in the Gulf States (133.8 million pounds), 35 percent, while those on the Pacific Coast amounted to 20.9 million pounds—a gain of 8.5 million pounds over 1960.

The otter trawl fleet took 168 million pounds--96 percent of the total catch. An additional 6.2 million pounds were taken by beam trawls. Bag nets, pots and traps, push nets, and cast nets accounted for the remainder.

In this Section is a detailed summary of the operating units engaged in the United States shrimp otter trawl fishery. The data include information on the fishermen employed and on the number of vessels, by tonnage classification, operated in each State and region. In 1961, there were 15,054 fishermen employed on 7,291 fishing craft which operated in the United States shrimp otter trawl fishery.

## UNITED STATES FISH OTTER TRAWL FLEET

There are included in this Section summaries of the United States fish otter trawl fleet. They contain detailed information on the operating units engaged in this fishery and a breakdown of vessels by area, State, and gross tonnage. In 1961, 1,232 vessels of over 5 net tons and 146 motor boats were in the fish otter trawl fleet. These fishing craft employed a total of 5,353 fishermen and operated 1,417 otter trawls. In some instances, two trawls were fished by a single vessel.

# **SECTION 12**

# HISTORICAL FISHERY STATISTICS

Statistics of the fisheries of the United States are necessary for the best use of the Nation's aquatic resources. As series of data for extended periods of time are accumulated, the information becomes increasingly more valuable in indicating trends in the supply and utilization of fishery products. The extent to which these data are used is frequently dependent upon the ready availability of needed information to researchers, management officials, and members of the fishing industry.

Periodically, there are published in "Fishery Statistics of the United States" historical data for each State on the catch of important species. The most recent publication of these data was in Statistical Digest No. 43 entitled "Fishery Statistics of the United States, 1956".

The Bureau of Commercial Fisheries has in its files and in various Bureau reports or publications of other organizations a large volume of historical data. These statistics would be of considerable use to researchers and others interested in the fisheries. Unfortunately, few know of these records. To make the series readily available to researchers and others interested in the fisheries, a section entitled "Historical Fishery Statistics" has been published, since 1951, in "Fishery Statistics of the United States." The titles of the series published, and the identifying number of the Digest in which each appears, follow:

|                                                                                                                                                                | Series                  | Published in<br>Statistical Digest                                           |

The lith series of historical data containing information on the California Mackerel Fishery is included in the following pages.

## CALIFORNIA MACKEREL FISHERIES, 1889-1961

By Harry S. Davis, Fishery Reporting Specialist Bureau of Commercial Fisheries Fish and Wildlife Service San Pedro, California

Landings of Pacific and jack mackerel at California ports during 1961 amounted to 141.7 million pounds valued at \$3 million. In total pounds landed at California ports, this was exceeded only by tuna; and in value received by fishermen, it was surpassed only by tuna and salmon. Prior to World War I, the mackerels were not too important to the fishing industry. However, with the advent of the canning of these fish, landings increased. The record Pacific mackerel catch of 146.4 million pounds was established in 1935; that for jack mackerel in 1952 was 146.5 million pounds. Total landings of both Pacific and jack mackerel established a combined alltime record in 1947 with landings of 175.5 million pounds.

## CALIFORNIA PACIFIC MACKEREL FISHERY

The Pacific mackerel is a member of the mackerel family <u>Scombridae</u> which also includes the Atlantic mackerel, the tunas, bonitos, and Spanish mackerel. Prior to World War I, the Pacific mackerel remained on the list of neglected fishes, but now supports an important industry. Although it is known that mackerel were taken as early as 1839, first recorded data in 1889 listed a catch of 315,000 pounds. Prior to 1926, statistical records combined the catch of Pacific and jack mackerel although the Pacific mackerel probably accounted for most of the landings. Since 1926, they have been separated.

The fishery for Pacific mackerel is closely related to that for sardines and catches often contained both species. During the thirties and forties, landings containing the two species were often listed as sardines. This was particularly so when sardines dominated the catch. The practice resulted in a tendency to underestimate Pacific mackerel landings. However, in recent years, catch statistics have been separated more completely.

In early years, Pacific mackerel were of relatively minor importance. A few hundred to a few thousand cases were canned each year, but these experimental packs met with little success. The fish was essentially an item destined for the fresh market. Between 1916 and 1926, the average annual catch amounted to only 3 million pounds.

After years of experimenting with canning methods and studying potential markets, a plant began large-scale mackerel canning operations late in 1927. Nearly 11,000 cases were packed in that year, and production jumped to almost 400,000 cases in 1928. During this period, the Philippine Islands and southeastern Asia were important outlets for canned sardines and salmon. Mackerel canners dressed their cans with labels resembling salmon labels and sent their pack into this area for marketing. The buyers, unfamiliar with mackerel, thought they were getting salmon at a low price. Sales mounted rapidly, which disturbed salmon packers who induced the Government to persuade the mackerel canners to offer their product on its own merits. Although sales dropped sharply at first, mackerel under its own name took its place alongside the sardine and salmon. The market was established, and canned mackerel became an important factor in the California fishing industry.

With an established market for canned mackerel, landings of Pacific mackerel increased rapidly. Catches climbed from 4.7 million pounds in 1927 to 35.3 million pounds in 1928, and up to 58 million pounds in 1929. The catch was drastically curtailed in 1930 with the advent of the depression and remained low until 1933 when landings increased to nearly 70 million pounds. The catch rose to 114 million pounds in 1934 and to an alltime high in 1935, when 146.4 million pounds were taken. Since 1935, landings have fluctuated due to the availability of fish and the canners' demand for mackerel.

Most of the present-day production of Pacific mackerel is canned for human consumption. The offal (inedible parts) from canning operations are processed into oil and meal. Small amounts are canned for pet food, and about 5 to 10 percent of the catch is marketed fresh. There is no closed season for the taking of Pacific mackerel in California, and they are caught throughout the year. However, larger catches are predominantly made from August to March, with a seasonal slack during the summer.

The methods and equipment used in fishing for Pacific mackerel have been changed drastically through the years. Prior to 1926, the fish were caught mainly by lines and gill nets. Small longline craft (26 to 36 feet long) fished four to six lines averaging about 1,250 feet each. Four hundred to 500 hooks were fastened to each line by leaders measuring about 18 inches. After the lines were set, they were buoyed to help the craft recover the gear and catch. Gill net boats were about the same size as the craft using lines. Nets were generally 300 to 400 yards long and about 10 yards deep. Pacific mackerel swimming into these nets could pass only part way

## HISTORICAL FISHERY STATISTICS

through a single mesh. In their struggle to get free, the twine slipped back of the gill covers preventing the fish from escaping. Fishing craft using lines or gill nets made daily trips. They sailed in the early morning and often returned with a catch before noon.

After 1927, the canners'demand for mackerel increased to the point where the supply could not be met by craft fishing lines and gill nets. It was then that the lampara net, operated by small craft, (25 to 40 feet in length) supplemented the supplies of mackerel taken by other gears. The net has a large central bunt and relatively short wings. The wings have a larger mesh than the bunt. The gear is played out from a vessel so as to surround a school of fish. The two wings are pulled simultaneously. There is no pursing device, as on a purse seine, other than the closing of the lead lines as the net is drawn through the water. The lampara is so called from the Italian word "lampo" meaning lightning. It is used chiefly in taking small fishes which move with great quickness. Although the lampara fishes fairly deep, its effective depth is not great and the fish have a chance to escape under the net before the lead line is aboard the fishing craft.

To correct the shortcomings of the lampara, modifications were made and the net gave way to the more efficient ring net and purse seine. By 1935, these gear surpassed the lampara net in volume of catch.

The ring net (also called purse lampara or halfring net) is, in effect, a lampara with a pursing arrangement whereby the lead line can be drawn together under the fish, effectively impounding them. The ring net combines the light weight, negligible bulk, speed, and low cost of the lampara with the positive action of the purse seine. The net is played out from the vessel to circle the school of fish. By the time the wings are hauled in, all the purse rings and the entire lead line are aboard concentrating the catch in the reinforced part of the bag known as the landing bay or sack.

The purse seine consists of a long wall of webbing without a prominent bunt or bag. The top edge is floated by a series of corks and the bottom edge weighted with leads. The net is pursed by drawing a purse line through a series of rings along the bottom of the net. The fish are captured by surrounding the school of mackerel, pursing the bottom of the net, and then concentrating the catch by pulling the net aboard the fishing vessel.

About this time, landings of mackerel were also increased by a fleet of small boats that employed striker or scooping techniques. The striker method of fishing utilized ground bait or chum to attract mackerel to the boat. In their frenzy to devour the chum, mackerel struck at feathered, barbless hooks attached by short lines to bamboo poles held by fishermen. The barbless hooks made it easy for the fishermen to deposit the catch aboard his craft. The scooping of mackerel was a natural outgrowth of the striker method and was accomplished by dipping the chum feeding mackerel into boats with long-hauled dip nets. The scoop was 20 to 30 inches in diameter with the pocket made of coarse chicken wire mounted on a 6-to 8-foot pole. The striker and scooping methods of fishing did not maintain their initial success, since it was found that fish taken by these gear spoiled rapidly due to their having fed on the chum.

Since 1950, purse seines have been the principal gear used to take mackerel. Vessels operating this gear range from 50 to 80 feet in length, use nylon seines, and are outfitted with power blocks. The carrying capacity of the vessels ranges from 40 to 140 tons. They carry a crew of 7 to 12 men each.

About 85 percent of the catch of the mackerelistakenatnight. The success of night fishing results from the ease of locating fish during dark nights of the month. A phosphorescent glow is created by schooling fish near the surface. Fishermen often refer to this as "fire in the water."

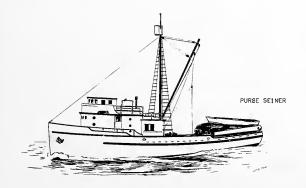

### CALIFORNIA JACK MACKEREL FISHERY

The jack mackerel is not a true mackerel. Although its physical appearance is similar to mackerel, it is a member of the family <u>Carangidae</u> in which are also classed the jacks, scads, and pompano. Prior to 1947, the fish were known as horse mackerel by fishermen who often mistakenly identified them as Spanish mackerel. While the name was not too important when the fishery was small, the marketing of an increasing canned pack called for a more desirable name. As a result of a survey by the California Department of Fish and Game, the species has been called jack mackerel since 1947. Prior to 1926, landings records combined the catch of jack and Pacific mackerel although Pacific mackerel probably accounted for most of the landings. Since 1926, statistics on the catch of jack mackerel have been shown separately.

Jack mackerel catch records for years prior to 1926 are almost nonexistent, although it was reported that landings were made as early as 1888. Catches of 119,000 pounds and 39,000 pounds were reported in 1895 and 1908, respectively. Average annual landings between 1926 and 1932 were less than 500,000 pounds. Between 1933 and 1945, the catch fluctuated between 1 million and 12 million pounds. By 1947, the rapidly failing sardine and Pacific mackerel fisheries caused the industry to begin an intensive fishery for jack mackerel, and landings soared to 129 million pounds in that year. Landings of jack mackerel declined to 73 million pounds in 1948, and to 51 million pounds in 1949, but climbed to 133 million pounds in 1950. The 90-million-pound production in 1951 was followed by the alltime record catch for jack mackerel (146.5 million pounds) in 1952. Landings of jack mackerel tend to fluctuate according to the success or failure of the sardine and Pacific mackerel fisheries and the availability of jack mackerel to the fishing fleets.

In addition to being canned for human consumption, jack mackerel are also used in canned pet food. The offal (inedible parts) from canning operations are processed into oil and meal. There is no regulated season for the taking of jack mackerel, but the larger catches are made from September to April.

The jack mackerel and Pacific mackerel fisheries are closely related. Both species are invariably taken by the same fishing craft and gear. Since 1926, the majority of the catch of jack mackerel has been taken by lampara and ring nets and purse seines. A description of the methods and equipment used in these fisheries is contained in the narrative analyses of the California Pacific mackerel fisheries on page 417 of this report.

# STATISTICAL SURVEY PROCEDURE

This report is another in a series of annual statistical reports containing detailed statistics, analytic textual reviews, and graphic presentations on the commercial fisheries of the United States. Included are data on the quantity and value of the commercial yield of fishery products by States, regions, waters, and gear; and the number of persons and operating units engaged in the fisheries. The publication contains data on the volume and value of processed fishery products, freezings and cold-storage holdings, foreign trade, and other related information. The report has been prepared and published by the Bureau of Commercial Fisheries, Fish and Wildlife Service, United States Department of the Interior, and is a continuation of a series inaugurated by its predecessor organizations in the Departments of Interior, Commerce, Commerce and Labor, and the United States Fish Commission.

In order that those who use the statistical data contained in this and previous reports may be informed as to the source of the figures and methods for their collection, it has been deemed advisable to outline, in moderate detail, the survey procedure followed. This procedure has been developed over a period of years, and changes in methods have been made at times when such changes have appeared to work toward general improvement. While the surveys in different sections are not made in the same manner, owing to varying facilities and records, an attempt has been made to make the data collected by various methods comparable with respect to the same year as well as over a period of years. Throughout the entire plan it has been the intention to coordinate State and federal fishery statistical work so that there will be as little duplication of effort as possible.

## SECTIONAL SURVEYS

Statistical surveys of the fisheries and fishery industries of the various sections of the United States occupy by far the greatest part of the time of the personnel of the Branch of Statistics. In the course of these surveys, the field representatives visit the individual fishing localities of the various States to collect statistics on the volume and value of the catch of fish and shell-fish, employment in the fisheries, quantity of

fishing gear, number and classification of fishing and transporting craft, and the volume and value of manufactured fishery products and byproducts. The various phases of these surveys are discussed in detail in the sections following.

History - - The first comprehensive statistical study of the fisheries and fishery industries of the United States was made for the year 1880 by George Brown Goode, Assistant Director of the United States National Museum, and associates, with the cooperation of the Commissioner of Fisheries and the Superintendent of the Tenth Census. Data for specific fisheries, or restricted sections for years prior to 1880, also were collected in the early survey and recorded in Mr. Goode's reports. The survey for 1880, however, did not include the Mississippi River and its tributaries. Periodic general surveys of a limited number of States or limited areas of the United States were made for the years from 1880 to 1907 and from 1909 to 1928. The first complete statistical canvass of the entire United States was made for 1908 by the Bureau of the Census. The next general survey of the entire United States was not made until 1931, although complete data for all sections, excluding the Mississippi River and its tributaries, were collected for 1929 and 1930. Complete data on the catch and operating units for these same sections were also collected for 1932. In the latter survey, however, lack of sufficient funds prohibited collection of data on the wholesale and manufacturing operations except those data collected as a part of the canned fishery products and byproducts survey. Various sections were surveyed during the years from 1933 to 1949, inclusive. A complete survey of all sections of the country was made for 1950. Since 1951, all of the coastal areas were canvassed annually, and catch records were obtained for the Lakes section. Complete operating unit and catch data have been obtained for all areas since 1954, except that only a partial survey of the Mississippi River and its tributaries was made for 1961. Data on the wholesale and manufacturing industries were collected in all of the surveys from 1933 to 1940, inclusive. In the years from 1941 to 1949, inclusive, and in 1951, lack of experienced personnel and budgetary limitations precluded the collection of data on wholesale and manufacturing firms except for those data collected as part of the canned fishery products, industrial products, and packaged fish surveys.

A chart on page 495 of "Fishery Statistics of the United States, 1960"-Statistical Digest 53 indicates the years for which surveys have been made in the various sections. Information concerning the completeness of the surveys in the various sections is contained in the following paragraph.

Since the surveys of the fisheries have varied in completeness three legends have been used for the years shown in the chart to indicate whether complete, partial, or no surveys were conducted in the individual regions. The designation "complete survey" has been used to indicate that basic operating unit and catch data were obtained and that complete information was collected on employment in wholesale and manufacturing establishments and on the production of manufactured fishery products. The legend "partial survey" usually indicates that operating unit and catch statistics were collected, but that no information was obtained on employment in wholesale and manufacturing establishments and that only partial data were obtained on the production of manufactured fishery products. In some instances the designation "partial survey" is used for regions in which only catch statistics were collected. The legend "no survey" indicates that a general canvass was not conducted to obtain operating unit, catch, employment in wholesale and manufacturing plants, and complete manufactured products data. Although the chart indicates that in certain regions no surveys were conducted, some information may be available on the landings at certain important ports. Likewise, information on the catch of certain species, such as menhaden, may be available as a result of data collected in connection with the annual canned fish and byproducts survey. Data on the annual production of canned fishery products and byproducts have been collected for all regions since 1921, while information has been obtained on the production of packaged fish for 1926 and annually since 1928.

A bibliography listing the various surveys made since 1880 and the publications in which the results were published appeared in Statistical Digest No. 43, "Fishery Statistics of the United States, 1956." A list of the statistical bulletins in the Current Fishery Statistics series published during 1961 may be found in Section 16 of this digest.

Field Personnel--The statistics contained in thie volume have been collected by a group of trained fishery reporting specialists of the Bureau.

Period Covered -- These specialists are assigned permanent field stations, generally in the principal port within their field, and travel from that station in conducting their various surveys. Most of the reporting agents collect statistics on landings for the current year, and assemble final operating unit, catch, and manufactured products data for the previous year. It is usually three to ten months after the end of the calendar year for which they are collecting data before the final figures for the digest are available. The data are tabulated and prepared for publication before the end of the year. The figures are collected and published on a calendar year basis. Prior to 1930, statistics on the catch of oysters in the Atlantic and Gulf States were collected for the oyster season; that is, from September to April, inclusive. Beginning with 1930 and continuing to the present time. they have been collected on the basis of the calendar year.

Scope - - The coastal statistical surveys include canvasses of the commercial fisheries of the oceans, bays, and coastal rivers as far inland as commercial fishing is important. This usually coincides with the range of commercial fishing for anadromous species. Statistics on the fisheries of the Mississippi River include those of the Mississippi River proper as well as all of its tributaries wherein commercial fishing for either fish, crustaceans, or mollusks is carried on. Statistics on the fisheries of the Great Lakes cover canvasses of the fisheries in the lakes proper, adjacent bays, the International Lakes of northern Minnesota, and rivers which sustain a commercial fishery having outlets into these waters. Statistics on the fisheries of Florida include the commercial fisheries in Lake Okeechobee and other inland lakes. Surveys for statistics of the wholesale and manufacturing fishery industries cover plants located in the coastal, river, and lake areas adjacent to the waters mentioned above.

Methods of Collection -- There are several methods used in the collection of fishery

statistics, each of which has been carefully studied to obtain the best results with available personnel and funds. In most instances the field personnel obtain from local customs officials lists of fishing vessels and names of owners of these craft. Also it is usually possible to obtain the names of licensed commercial fishermen, fishing craft, and some statistics on the catch, from State fishery agencies; from other State, county, or city sources; or from private organizations.

Using available preliminary records as a quide, the field specialists visit each fishing community in their field unless these preliminary records are so complete that personal visits may be eliminated. If complete catch data are not available from central sources, wholesale dealers and manufacturers of fishery products are visited and data are obtained from them on their purchases of fish and shellfish. It is impossible for the few Bureau representatives available for this work to interview each fisherman in a given locality. However, the more important areas and a sufficient number of areas of lesser importance are visited to obtain reliable information on production, the number of fishing craft engaged, the quantity of gear operated, catch by gear and waters, and the number of persons employed as fishermen.

The Bureau's role with regard to fishery statistics is principally that of coordinating the collection of information, assembling, analyzing, publishing, and disseminating fishery data. The collection of basic operating unit and catch statistics is primarily a State function. The State fishery agencies in a number of States have developed relatively complete statistical systems which greatly facilitate the Bureau's surveys in these States. In such instances, the Bureau conducts only such surveys as may be necessary to make the data comparable with those of other States.

The Bureau obtains from the records of the State fishery agencies most of the catch statistics for the fisheries of the Great Lakes, the northern Mississippi River area, and the International Lakes of northern Minnesota. Toobtain data on the number of fishermen, boats, vessels, and gear, the Bureau conducts such personal surveys among the fishermen as may be necessary

to supplement the State records.

Bureau statistical personel are stationed at Seattle, Washington and San Pedro, California for the purpose of surveying the fisheries of Washington, Oregon, and California. They obtain from the records of the State fishery departments figures on the volume of the catch and operating units. The value of the catch is derived from State and dealers' records. In Washington and Oregon, data for operating units in the offshore fisheries are obtained from the records of various fishery organizations as well as from records of the State fishery agencies. Statistics of the wholesale fishery industry for this section are obtained largely by personal interviews.

In many States, the Bureau and the fishery agency of the respective States cooperate in the collection and publication of current monthly and annual data on the catch. These data form the basis of the annual catch figures published in this report for the following States: Maine, Massachusetts, Rhode Island, New York, New Jersey, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Texas, California, Ohio, Michigan, and Wisconsin.

In the administration of the Alaska fisheries, the State requires that copies of all receipts for fish and shellfish purchases from fishermen be furnished to the Alaska Department of Fish and Game. The data on these tickets are compiled and made available to the Bureau. The summary data, by districts, are reproduced in this report.

Statistics on the volume of the catch of fish in the Great Lakes States usually are shown in weights aslanded, which may be in the round or drawn condition. Statistics on the volume of the catch of fish taken in the remainder of the United States are usually shown in round weight.

The figures in the tables for shellfish represent the weight of the meats in the cases of univalve and bivalve mollusks, and the round weight of crustaceans and such mollusks as squid and octopus.

Shore and Vessel Fisheries--In general, statistics of the shore fisheries, as collected by the Bureau's representatives, include

data on the number of casual and regular fishermen; number of motor and other fishing boats (craft of less than 5 net tons capacity are called "boats"); type and quantity of gear used; and the volume, value, and method of capture of each species for each locality or group of localities. This method is not followed in some sections where the availability of data collected by the State fishery agencies obviates the necessity of detailed locality surveys.

Statistics of the vessel fisheries include data on the number in the crew; rig of vessels; gross tonnage; kind and quantity of gear used; and volume, value, and method of capture of each species. Craft having a capacity of 5 net tons or over are called "vessels." As in the shore fisheries, the availability of figures collected by State fishery agencies may eliminate the necessity of Bureau agents collecting these data for individual vessels. Information on the year vessels were built was assembled for 1961.

Statistics on the quantity of gear operated indicate the maximum number of units fished at any one time during the year. Gear carried in reserve for replacement is not reported.

All persons engaged in commercial fishing operations are included as fishermen. In most areasfishermen not on vessels have been divided into "regular" and "casual". Regular fishermen are defined as those who receive more than one-half their annual income from fishing; whereas casual fishermen are those who receive less than one-half their annual compensation from fishing. On the Pacific Coastit has not been possible to separate regular from casual fishermen.

Since 1942, the catch of fish and shellfish has been credited to the port at which it was landed. Prior to the survey for that year, it was the practice of the Bureau to credit the entire catch of a vessel to the principal port at which fish or shellfish were unloaded, regardless of the actual point of landing. This policy was discontinued since it quite often resulted in inconsistencies by crediting catches of some species to areas far removed from localities in which they are commonly taken. An outstanding example of this is the southern trawl fishery conducted off the New Jersey, Maryland, Virginia, and North Carolina coasts. Some fishing vessels from New

England operate in this fishery for 6 to 10 weeks during the winter season. Prior to the survey for 1942, the catch of these vessels, consisting principally of fish common to Middle Atlantic waters, was credited to Massachusetts. Under the present system, this catch is credited to the Middle Atlantic ports where it is landed.

Since 1949 on the Pacific Coast and 1951 for the remainder of the country, craft, fishermen, and gear have been reported for each State in which they fished. A total exclusive of duplication is shown for each section, and for the United States as a whole. Prior to the surveys for 1949, each craft on the Pacific Coast was credited to its home port unless it did not fish from that port during the year. In that case, it was credited to the locality where it landed the greatest portion of its catch. Prior to the survey for 1951, each craft on the Atlantic and Gulf Coasts and interior waters was credited to the port where it landed the greatest portion of its catch during the year. This system was changed to provide more accurate data on the total number of craft operating in a given State. With the increased mobility of the fishing fleet in recent years, the number of vessels fishing in more than one State has increased greatly.

Beginning with data for 1951, the reporting of units of gear was standardized so that nets or lines made up of small units for ease in handling, but fastened together in fishing, were counted as a single unitrather than as a number of smaller units. Prior to 1951, the small units were sometimes counted as individual pieces of gear even though they were combined for fishing. This rule does not apply to halibut longlines or setlines on the Pacific Coast. In this fishery each skate of gear is counted as one line, even though they are fastened together in fishing, because the International Pacific Halibut Commission uses a skate of gear as a unit in its studies of fishing intensity.

Publication of Data--Statistics on employment in the fisheries, craft and gear engaged, quantity and value of catch, and certain data on industries related to the fisheries are summarized according to geographic divisions and published in bulletin form as soon as possible after the completion of each survey. Later, the figures, in more detail, are included in the

annual statistical report of the Bureau entitled "Fishery Statistics of the United States."

Data on the operating units (fishermen, fishing craft, and gear) and catch by counties for the Atlantic and Gulf States have been included in these annual statistical reports for the years from 1928 to 1938 except for 1932. These data have also been published in the digests for the years 1945, 1950, 1955, and 1960. County data were collected for the State in which surveys were conducted during the years since 1938, except for Maryland. Between 1942 and 1959, only operating unit data by counties have been obtained for Maryland. Complete data were obtained for 1960. County data assembled for the years since 1938, which were not published in the Digest, are on file in the Washington office of the Bureau.

#### LOCAL AND SPECIAL SURVEYS

Landings at Certain Massachusetts Ports - Detailed statistics are collected on the landings of aquatic products by individual fishing craft at Boston, Gloucester, New Bedford, Plymouth, Provincetown, and other Cape Cod ports. Bureau representatives are stationed at the principal ports. They obtain figures on the quantity and value of fish landed daily by fishing craft, the dates of departure and arrival of the craft, the gear used in their capture, the grounds from which the fish were taken, and other related information. The Bureau's Division of Biological Research and the Branch of Market News cooperate in the collection of these data.

Statistics on landings at the above ports are released monthly and annually in bulletin form, and detailed data are published in the annual statistical digest. Products of American fisheries received duty free at Boston and Gloucester from the treaty coasts of Newfoundland, Magdalen Islands, and Labrador, have not been included in the landings at these ports since 1938. Data on the landings at Boston and Gloucester have been collected annually since 1893. Information on landings at New Bedford has been collected annually since 1938 and at Plymouth, Provincetown, and other Cape Cod ports since 1945.

Shad and Alewife Fisheries--Owing to the importance of the Hudson and Potomac

Rivers in the production of shad, surveys for statistics of the catch, value of the catch, and operating units are made annually. On the Potomac River similar statistics are also obtained for the alewife fishery. Much of the data required for these surveys is available from the State fishery agencies.

Annual data on the shad and alewife fisheries are not published separately in bulletin form. However, a summary is published in the annual statistical digest.

Statistics on the Hudson River shad fishery are available for 1896, 1897, 1898, 1901, 1904, 1910, and annually since 1915, while data for the Potomac River shad fishery are available for 1896, 1901, 1904, 1909, 1915, from 1919 to 1942, inclusive, and annually since 1944. Statistics of the Potomac River alewife fishery are available for 1896, 1909, 1915, from 1919 to 1942, inclusive, and annually since 1944.

Pacific Halibut Fishery -- Statistics on the Pacific halibut fishery are obtained primarily from the International Pacific Halibut Commission. Beginning with data for 1956 the fleet classification of halibut craft was revised and vessels were credited in operating unit tables to each district in which they landed fish; the only exception being that United States vessels landing at Prince Rupert, British Columbia, are credited to Southeastern Alaska. Duplication of halibut craft which operated in more than one district has been eliminated in regional and national totals. The catch by the halibut fleet is credited to the port of landing except that fish landed by United States halibut craft in British Columbia is credited to Southeastern Alaska. Halibut statistics are also included in the monthly and annual summaries published by the Seattle Market News Office. Statistics on the landings of halibut at Pacific Coast ports have been collected since 1925.

South Atlantic and Gulf of Mexico Shrimp Fishery-Detailed statistics on the quantity and value of shrimp, by variety and size, landed at South Atlantic and Gulf ports, have been collected for the Gulfarea since 1956 and the South Atlantic since 1957. Since 1956, Bureau agents have also obtained daily information on the number of fishing trips, area and

depth fished, and time spent in fishing by craft landing at United States ports in the Gulf of Mexico. The Branch of Market News, the Bureau's Branch of Marine Fisheries of the Division of Blological Research, and various fishery agencies of the southern States cooperate in the collection of these data.

Detailed monthly and annual summaries of the statistics on shrimp landings are published in bulletin form and are summarized in the annual statistical digests.

Hawaiian Fisheries—The volume and value, by species, of the catch landed monthly in the State of Hawaii are furnished the Bureau by the Department of Land and Natural Resources, Division of Fish and Game, Honolulu, Hawaii. Although these data have been published in the Hawaii section of the Digest since 1946, it was not until 1959 that operating unit, catch, and manufactured products data, although incomplete, were included in the national summary table together with those for other States. The common and scientific names of the species of fish and shellfish landed in Hawaii are not included in Section 14 of this report.

Historical Fishery Statistics - The Bureau of Commercial Fisheries has in its files and invarious Bureau reports or publications of other organizations a large volume of historical data on fisheries. Beginning with the 1951 Digest, a section entitled "Historical Fishery Statistics," which includes complete historical information on selected species, has been carried. There is published each year a listing of the titles of the series of data appearing in earlier editions.

Menhaden Purse Seine, Shrimp and Fish Otter Trawl, and Salmon Troll Fleets—Beginning with 1957, detailed data have been published in Section 12 of these digests on the menhaden purse seine and otter trawl fleets. Similar data for the salmon troll fishery have been included since 1960. The sumary operating unit data include information for craft in these fisheries by area, State, and gross tonnage. Prior to 1957, these data were not available since it was impossible to determine from regular operating unit tables the duplication between areas in fishermen and craft.

Canned Fishery Products and Industrial Products - - Beginning in 1921, the Bureau has made annual surveys for statistics of the canned fishery products and industrial products of every section. These are started the first week in January of each year for statistics on the production in the preceding year. So far as possible, the Bureau obtains by mail, for each domestic canned fishery products and industrial plant, figures on its annual production. Where it is impossible to obtain the information by mail, the report is secured by a Bureau agent, Included in the data obtained are statistics on the yield and value of the canned products by type of commodity, can size, and area of production. Data on industrial products are obtained by commodity and area of production. The value shown for canned and industrial products is in the gross amount received by the packer at the production point. No deductions are made for commissions or expenses.

Annual statistical bulletins are issued on this trade, and detailed statistics are published in the annual statistical digest. Prior to 1921, canned and industrial products data were not collected for the entire country. However, data on the production of these products were usually obtained for the areas in which general canvass surveys were conducted.

· Fish Meal and Oil--Data are collected monthly on the domestic production of fish meal, body oil, fish solubles, and homogenized condensed fish. This information is released monthly and annually in the Bureau's Current Fishery Statistics series of bulletins.

Packaged Fish Trade--Statistics on the annual production and value of fish packaged in the United States, exclusive of the States of Alaska and Hawaii, are obtained in conjunction with the canned and industrial fishery products survey. These data are released annually in bulletin form and in the annual statistical digest. Statistics on the production of packaged fish are available for 1926 and annually since 1928, except that no data were collected in California for the years 1941 to 1946, inclusive.

Fish Sticks and Portions -- Quarterly information is collected and published on

the production and value of cooked and raw fish sticks and breaded, cooked, and raw fish portions, and unbreaded fish portions. The data are released in the Bureau's Current Fishery Statistics series of bulletins.

Cold-Storage Holdings of Fish--Information on the monthly freezings and holdings of fishery products is obtained from cold storage warehouses by mail and by Bureau employees. Data are also obtained on the holdings of certain cured fish. Bulletins showing these statistics are issued monthly and annually.

Detailed cold-storage statistics also are published in the Bureau's annual statistical digest. Information regarding cold-storage holdings of fishery products has been published since 1917, while data on the quantity of fish frozen have been released for the years from 1920 to 1925, inclusive, and annually since 1928.

Foreign Fishery Trade -- Statistics on foreign fishery trade are obtained from compilations made by the Bureau of the Census, Department of Commerce. Statistics on all known imported or exported fishery products have been assembled and published annually since 1926 in the Bureau's statistical digest. For earlier years, figures are available in the reports of the Bureau of the Census, Bureau of Foreign and Domestic Commerce, the Bureau of Statistics, the Department of Commerce and Labor, or the Treasury Department.

#### PRACTICES AND TERMS

Certain practices and terms used in this report are explained below.

Operating Units -- Operating units as referred to in this report include persons employed in the fisheries, and craft and gear engaged in the fisheries.

 $\label{thm:condition} \mbox{Vessel--The term "vessel" refers to a craft having a capacity of 5 net tons or over.}$ 

 ${\tt Boat--The\ term\ "boat"}$  refers to a craft having a capacity of less than 5 net tons.

Days Absent--In computing "days absent" for vessels landing fares at certain Massachusetts ports, the day of arrival, but not the day of departure is included; thus, a vesselleaving port on the 8th of the month and returning on the 15th of the month will be credited with 7 days absence. Prior to 1944, "days absent" included both the day of departure and the day of arrival.

Days Fished--Incomputing "daysfished" for fishing craft landing shrimp at Gulf of Mexico ports, the total number of hours spent in fishing effort has been divided by 24.

Fish -- The term "fish" as used in this report includes all species belonging to the class <u>Pisces</u>.

Shellfish, etc.--A shellfish is an aquatic invertebrate animal having a shell, such as a mollusk or crustacean. However, in order to reduce the classifications appearing in the catch tables, all items not properly listed as "Fish" or "Whale Products" have been included under "Shellfish, etc." Accordingly, there is included under this classification turtles, frogs, sponges, seaweed, and worms.

Whale Products--Since data are not available on the poundage of whales taken, statistics appearing in catch tables on the yield of these mammals represent the weight of products produced such as meal, sperm oil, whale oil, etc. The values shown represent the amountreceived by the manufacturer for the products.

Incidental Catch--Theterm "incidental catch" refers to the catch of certain species by a type of gear which ordinarily does not capture such species.

Percentages -- Percentages are usually shown as whole numbers. Fractions of percents are dropped if less than five-tenths, and the percentage is raised to the next higher integer if the fraction is greater than five-tenths. If the fraction is exactly five-tenths, odd integers are raised to the next even figure while even integers remain unchanged.

Converting - - Many of the figures shown in the summary tables published herewith have been converted to thousands of pounds or thousands of dollars. In making these conversions the sum of the items in a table is raised or low-

ered to the nearest thousand in accordance with standard statistical procedures. The individual items are adjusted to conform to the total thus obtained.

Confidential Data -- The statistical data collected by the Bureau are confidential, and, unless specific authorization is given, are not released in a manner that would divulge private enterprise.

#### **CONVERSION FACTORS**

It is the policy of the Bureau to show detailed catch figures of all products in pounds for the sake of uniformity and for purposes of comparison. This represents little difficulty in the case of fish, since in very rare instances are fish reported in units of measure other than pounds. For shellfish, however, the units of measure may be bushels, sacks, barrels, numbers, gallons of meats, etc. These many units make standardization difficult, and when combined with the wide variation in the requirements or definitions of some of these units in the various states, the problem becomes even more complex.

All univalve and bivalve mollusks (except fresh-water mussel shells) are reported in pounds

of meats in the detailed catch tables presented in this report. In addition, there are included supplementary tables for most of the sections, which give data on the production in bushels. These supplementary tables also give the production in number of certain other shellfish, such as crabs. There also is included in the General Review section of this report a table containing data on the shell weight of univalve and bivalve mollusks taken.

Oysters - - Probably the greatest problem in the presentation of fishery statistics in uniform units of measure is in the case of oysters. Usually the production of oysters on the Atlantic and Gulf Coasts is reported to Bureau personnel in bushels. Prior to the data obtained for the year 1930, bushels were converted to pounds of meats on the basis of a uniform yield of 7 pounds of meats to the bushel. However, it was found that there was considerable variation in the yield of oysters per bushel particularly in southern states where the yield has ranged as low as half the conversion factor used prior to 1930. There follows a table which gives the measures used for oysters in the various States and the average yields perbushel. The statistical tables in this report are based on these average yields.

## STATISTICAL SURVEY PROCEDURE

#### MEASURES AND YIELDS OF OYSTERS

| 27.75                                                                                                                                                                                                                | CAPACITY OF                                                                                                                                                                   | VARIATION                                                                                                                                         | FROM    | YIELD OF MARKE                                                                                                                                                                             | T OYSTERS, 1961                                                                                                             |

As many of the readers of this publication may not be familiar with all of the species of fish and shellfish, etc., taken commercially in the United States, illustrations of many of the various species are included in the following pages. The descriptive material appearing with each species includes the areas in which commercial landings are made in the United States and does not constitute the extreme limits in which they occur. Similarly, the gear listed for each species do not represent the only types of apparatus by which these species are obtained, but represent those types which are normally used in their capture. The gear do not necessarily appear in the order of their importance. Illustrations of species landed in Hawaii are not included in this section.

For more detailed information on the nomenclature of the fishery products listed below, the reader is referred to Section 14 of this publication entitled, "Glossary."

ALEWIFE ALEWIFE
RANGE - FLDRIDA TO NEW ENGLAND
GEAR - POUND NETS, GILL NETS, WEIRS,
DIP NETS, HAUL SEINES, FLOATING TRAPS,
FYKE NETS

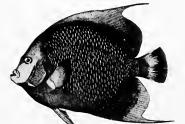

RANGE - NEW JERSEY TO MASSACHUSETTS GEAR - DITTER TRAWLS, POUND NETS

AMBERJACK RANGE - FLORIDA
GEAR - HANDLINES. TROLL LINES

ANCHOVY RANGE - CALIFORNIA TO WASHINGTON GEAR - PURSE SEINES AND HAUL SEINES

ANGELFISH RANGE - FLORIDA GEAR - HAUL SEINES

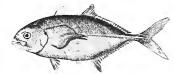

BARRACUDA (ATLANTIC) RANGE - FLORIDA GEAR - TROLL'LINES, HANDLINES

BARRACUDA (PACIFIC)
RANGE - CALIFORNIA
GEAR - PURSE SEINES, LONGLINES, HANDLINES, TROLL LINES, GILL AND TRAMMEL NETS

BLUEFISH RANGE - GULF OF MEXICO TO NEW ENGLAND GEAR - HAUL SEINES, GILL NETS, POUND NETS, TROLL LINES, PURSE SEINES

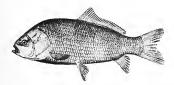

BLUE RUNNER OR HARDTAIL RANGE - GULF OF MEXICO GEAR - HAUL SEINES, GILL NETS, POTS

BONITO (ATLANTIC) RANGE - NORTH CAROLINA TO MASSACHUSETTS GEAR - POUNO NETS, TROLL LINES, GILL NETS

BOWFIN RANGE - FRESH-WATER GEAR - HAUL SEINES, TRAP NETS, FYKE NETS

BUFFALOFISH RANGE - FRESH-WATER GEAR - HAUL SEINES, FYKE NETS, TRAMMEL NETS, TROTLINES

BURBOT RANGE - GREAT LAKES GEAR - GILL NETS, FYKE NETS, POUND NETS, TRAP NETS

BUTTERFISH
RANGE - FLORIDA TO NEW ENGLAND
GEAR - POUND NETS, HAUL SEINES, OTTER TRAWLS

CABIO RANGE - FLORIDA TO VIRGINIA GEAR - HANDLINES, POUND NETS

CARP RANGE - FRESH-WATER GEAR - HAUL SEINES, GILL NETS, TRAP NETS, FYKE NETS, POUND NETS, TROTLINES

CATFISH RANGE - FRESH-WATER GEAR - HAUL SEINES, TROTLINES, POUND NETS, POTS, FYKE NETS

CHUB RANGE - GREAT LAKES GEAR - GILL NETS

CIGARFISH RANGE - FLORIDA GEAR - HAUL SEINES

COD
RANGE - VIRGINIA TO MAINE, WASHINGTON,
AND ALASKA
GEAR - OTTER TRAWLS, LONGLINES, GILL NETS

CRAPPIE
RANGE - FRESH-WATER LAKES
GEAR - HAUL SEINES, LINES, POTS

CREVALLE
RANGE - SQUTH ATLANTIC AND GULF STATES
GEAR - HAUL SEINES, GILL NETS, LINES

CROAKER
RANGE - GULF OF MEXICO TO NEW YORK
GEAR - POUND NETS, OTTER TRAWLS, HAUL SEINES,
GILL NETS

CUNNER RANGE - NEW ENGLAND GEAR - OTTER TRAWLS, HANDLINES

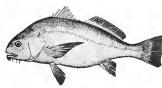

CUSK
RANGE - NEW ENGLAND
GEAR - OTTER TRAWLS, LONGLINES

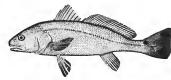

DOLLY VAROEN TROUT RANGE - PACIFIC GEAR --POUND NETS, GILL NETS, LINES

DOLPHIN RANGE - FLORIDA TO NORTH CAROLINA GEAR - TROLL LINES

DRUM, BLACK RANGE - TEXAS TO NORTH CAROLINA GEAR - HAUL SEINES, POUND NETS, LINES

DRUM, RED RANGE - TEXAS - MARYLAND GEAR - POUND NETS, HAUL SEINES, GILL NETS, LINES

EEL, COMMON
RANGE - FLORIDA TO NEW ENGLAND AND IN
MISSISSIPPI RIVER, LAKE ONTARIO
GEAR - POTS, SPEARS, POUND NETS

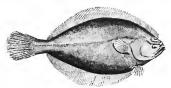

EEL, CONGER RANGE - FLORIDA TO NEW ENGLAND GEAR - OTTER TRAWLS

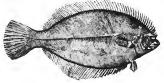

GRAY SOLE RANGE - MASSACHUSETTS TO MAINE GEAR - OTTER TRAWLS

LEMON SOLE RANGE - NEW YORK TO MAINE GEAR - OTTER TRAWLS

DAB RANGE - MASSACHUSETTS TO NOVA SCOTIA GEAR - OTTER TRAWLS, LONGLINES

BLACKBACK OR WINTER FLOUNDER RANGE - NORTH CAROLINA TO MAINE GEAR - OTTER TRAWLS, POUND NETS, FYKE NETS, SPEARS, LINES

FLUKE RANGE - TEXAS TO MASSACHUSETTS GEAR - OTTER TRAWL, SPEARS, LINES

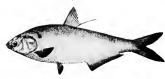

FLYING FISH RANGE - PACIFIC AND ATLANTIC OCEANS GEAR - GILL NETS

FRIGATE MACKEREL RANGE - MIDDLE ATLANTIC GEAR - POUND NETS

GARFISH RANGE - FRESH-WATER GEAR - HAUL SEINES, LINES

GIZZARD SHAD
RANGE - NORTH CAROLINA TO MARYLAND,
GREAT LAKES
GEAR - HAUL SEINES, POUND NETS, GILL NETS

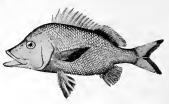

GOLDFISH RANGE - LAKES AND RIVERS GEAR - HAUL SEINES, TRAP NETS, FYKE NETS

GRAYFISH
RANGE - PACIFIC
GEAR - LONGLINES, OTTER TRAWLS, GILL NETS

GROUPER
RANGE - TEXAS TO SOUTH C. ROLINA
GEAR - HANDLINES, POTS

GRUNT RANGE - FLORIDA GEAR - POTS, GILL NETS, LINES

HADDOCK
RANGE - NEW ENGLAND STATES
GEAR - OTTER TRAWLS, GILL NETS, LONGLINES

HAKE, RED
RANGE - CHESAPEAKE BAY TO NEW ENGLAND
GEAR - GILL NETS, OTTER TRAWLS, LONGLINES

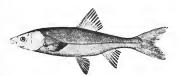

HAKE, WHITE RANGE - CHESAPEAKE BAY TO NEW ENGLAND GEAR - GILL NETS, OTTER TRAWLS, LONGLINES

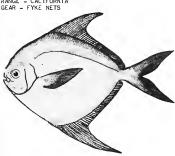

HAKE (PACIFIC) RANGE - PACIFIC GEAR - OTTER TRAWLS

HALIBUT RANGE - PACIFIC COAST - NEW ENGLAND GEAR - LONGLINES, OTTER TRAWLS

HARDHEAD RANGE - CALIFORNIA GEAR - FYKE NETS

HARVESTFISH OR "STARFISH" RANGE - NORTH CAROLINA TO CHESAPEAKE BAY GEAR - HAUL SEINES, POUND NETS

HERRING, LAKE RANGE - GREAT LAKES GEAR - GILL NETS, HAUL SEINES, POUND NETS, TRAP NETS

HERRING, SEA RANGE - NEW JERSEY TO NEW ENGLAND, PACIFIC COAST STATES AND ALASKA GEAR - PURSE SEINES, WEIRS, FLOATING TRAPS, STOP SEINES

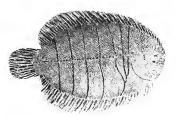

HICKORY SHAD

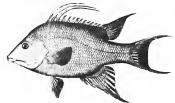

RANGE - FLORIDA TO RHODE ISLAND

GEAR - POUND NETS, HAUL SEINES, GILL NETS

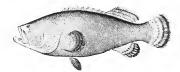

FLOATING TRAPS

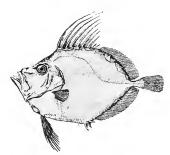

HOGCHOKER RANGE - CHESAPEAKE BAY GEAR - POUND NETS, HAUL SEINES

HOGFISH RANGE - FLORIDA GEAR - LINES

JEWFISH RANGE - FLORIDA GEAR - HANDLINES

JOHN DORY RANGE - MIDDLE ATLANTIC STATES GEAR - OTTER TRAWLS

KING MACKEREL RANGE - TEXAS TO NEW YORK GEAR - TROLL LINES, GILL NETS, HANDLINES

KING WHITING RANGE - TEXAS TO MASSACHUSETTS GEAR - OTTER TRAWLS, HAUL SEINES, POUNO NETS

LAKE TROUT RANGE - GREAT LAKES GEAR - GILL NETS, LINES, POUND NETS (TRAP NETS)

LAMPREY RANGE - FRESH-WATER GEAR - POTS, FYKE NETS

LAUNCE RANGE - NEW ENGLAND GEAR - HAUL SEINES

LINGCOD
RANGE - CALIFORNIA TO ALASKA
GEAR - OTTER TRAWLS, LONGLINES, HANDLINES

MACKEREL, ATLANTIC RANGE - CHESAPEAKE BAY TO MAINE GEAR - PURSE SEINES, GILL NETS, POUND NETS, FLOATING TRAPS

MACKEREL, JACK RANGE - CALIFORNIA GEAR - LINES, SEINES, LAMPARA NETS

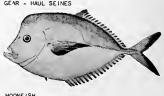

MACKEREL, PACIFIC RANGE - CALIFORNIA GEAR - LINES, SEINES. LAMPARA NETS

MENHADEN
RANGE - GULF OF MEXICO TO NEW ENGLAND
GEAR - PURSE SEINES. POUND NETS

MOONEYE RANGE - GREAT LAKES GEAR - HAUL SEINES

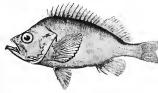

MOONFISH RANGE - FLORIDA GEAR - HANDLINES, HAUL SEINES

MULLET RANGE - TEXAS TO NEW JERSEY GEAR - GILL NETS, HAUL SEINES, POUND NETS, CAST NETS

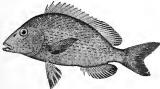

OCEAN POUT RANGE - NEW ENGLAND GEAR - OTTER TRAWLS

OCEAN PERCH RANGE - NEW ENGLAND GEAR - OTTER TRAWLS

PADDLEFISH RANGE - GULF OF MEXICO, MISSISSIPPI RIVER GEAR - HAUL SEINES, TROTLINES

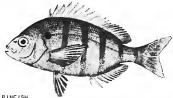

PIGFISH RANGE - FLORIDA GEAR - POTS, HANDLINES, GILL NETS

PIKE OR PICKEREL RANGE - FRESH-WATER GEAR - TRAP NETS, FYKE NETS, GILL NETS, POUND NETS, HANDLINES

SARDINE, PACIFIC (PILCHARD) RANGE - CALIFORNIA TO WASHINGTON GEAR - PURSE SEINES, LAMPARA AND RING NETS, GILL NETS

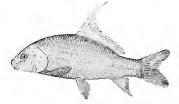

PINFISH
RANGE - FLORIDA TO NORTH CAROLINA
GEAR - HAUL SEINES, GILL NETS

POLLOCK
RANGE - MIDDLE ATLANTIC AND NEW ENGLAND STATES
GEAR - LONGLINES, FLOATING TRAPS, POUND NETS,
OTTER TRAWLS, GILL NETS

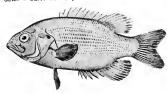

POMPANO
RANGE - TEXAS TO NORTH CAROLINA
GEAR - TRAMMEL NETS, HAUL SEINES, GILL NETS,
HANDLINES

QUILLBACK RANGE - FRESH-WATER GEAR - HAUL SEINES, TROTLINES, FYKE NETS

RATFISH RANGE - WASHINGTON TO ALASKA GEAR - BEAM TRAWLS, LONGLINES

ROCK BASS RANGE - GREAT LAKES GEAR - TRAP NETS, FYKE NETS, HAUL SEINES, GILL NETS

ROCKFISH
RANGE - CALIFORNIA TO ALASKA
GEAR - LINES, OTTER TRAWLS, PARANZELLA NETS,
GILL NETS

RUDDERFISH RANGE - CALIFORNIA GEAR - LAMPARA AND RING NETS

SABLEFISH RANGE - PACIFIC COAST STATES AND ALASKA GEAR - LONGLINES, OTTER TRAWLS

SALMON, CHINOOK OR KING RANGE - CALIFORNIA TO ALASKA GEAR - POUND NETS, PURSE SEINES, GILL NETS, HAUL SEINES, TROLL LINES, REEF NETS

SALMON, CHUM OR KETA RANGE – OREGON TO ALASKA GEAR – POUND NETS, PURSE SEINES, GILL NETS, HAUL SEINES, REEF NETS

SALMON, PINK RANGE - WASHINGTON TO ALASKA GEAR - PURSE SEINES, POUND NETS, GILL NETS REEF NETS

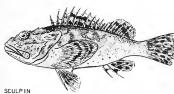

SALMON, RED OR SOCKEYE RANGE - OREGON TO ALASKA GEAR - GILL NETS, PURSE SEINES, POUND NETS, REEF NETS

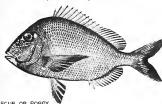

SALMON, SILVER OR COHO RANGE - CALIFORNIA TO ALASKA GEAR - HAUL SEINES, PURSE SEINES, GILL NETS, TROLL LINES, POUNO NETS, REEF NETS

SAUGER RANGE - GREAT LAKES GEAR - GILL NETS, HAUL SEINES, TRAP NETS, FYKE NETS

SCULPIN
RANGE - PACIFIC COAST STATES AND ALASKA
GEAR - LINES, GILL NETS, POTS

SCUP OR PORGY RANGE - FLORIOA TO NEW ENGLAND GEAR - OTTER TRAWLS, POUND NETS

SEA BASS
RANGE - FLORIDA TO NEW ENGLAND
GEAR - OTTER TRAWLS, HANDLINES, POTS

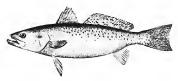

SEA CATFISH
RANGE - TEXAS TO CHESAPEAKE BAY
GEAR - OTTER TRAWLS, HAUL SEINES, HANDLINES

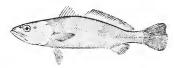

SEA ROBIN RANGE - CHESAPEAKE BAY TO NEW ENGLAND GEAR - POUND NETS, OTTER TRAWLS

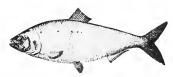

SEA TROUT OR WEAKFISH, GRAY RANGE - FLORIDA TO MASSACHUSETTS GEAR - OTTER TRAWLS, POUND NETS, PURSE SEINES, GILL NETS, HAUL SEINES

SEA TROUT OR WEAKFISH, SPOTTED RANGE - MARYLAND TO TEXAS GEAR - GILL NETS, TRAMMEL NETS, HAUL SEINES, POUND NETS, OTTER TRAWLS, HANDLINES

SEA TROUT OR WEAKFISH, WHITE RANGE - GULF OF MEXICO GEAR - GILL NETS, HAUL SEINES, HANDLINES

SHAD RANGE - FLORIDA TO NEW ENGLAND GEAR - GILL NETS, POUND NETS, FYKE NETS, HAUL SEINES

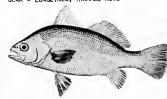

SHARK
RANGE - ATLANTIC COAST, GULF, PACIFIC COAST STATES
GEAR - LONGLINES, GILL NETS, OTTER TRAWLS

SHEEPSHEAD RANGE - TEXAS TO CHESAPEAKE BAY GEAR - HANDLINES, PDTS

SHEEPSHEAD, CALIFORNIA RANGE - CALIFORNIA GEAR - LONGLINES, TRAMMEL NETS

SAND PERCH RANGE - TEXAS TO NEW YORK GEAR - HAUL SEINES, GILL NETS, POUND NETS

SILVERSIDES RANGE - NEW YORK GEAR - HAUL SEINES, OTTER TRAWLS

SKATE RANGE - PACIFIC COAST, CHESAPEAKE BAY TO NEW ENGLAND GEAR - LINES, DTTER TRAWLS, POUND NETS, HAUL SEINES

SKIPPER RANGE - VIRGINIA TO NOVA SCOTIA GEAR - POUND NETS, WEIRS

SMELT
RANGE - NEW YORK TO MAINE, PACIFIC OCEAN,
GREAT LAKES
GEAR - POUND NETS, DIP NETS, GILL NETS, HAUL SEINES

SNAPPER, MANGROVE RANGE - FLORIDA GEAR - HANDLINES, GILL NETS

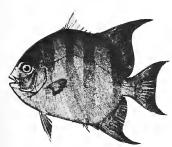

SNAPPER, LANE RANGE - FLORIDA GEAR - HANDLINES

SNAPPER, RED RANGE - TEXAS TO FLORIDA GEAR - HANDLINES

SNOOK RANGE - TEXAS TO FLORIDA GEAR - GILL NETS, HANDLINES, HAUL SEINES

SPAOEFISH RANGE - FLORIDA GEAR - GILL NETS, TRAMMEL NETS

SPANISH MACKEREL RANGE - TEXAS TO VIRGINIA GEAR - GILL NETS, LINES, HAUL SEINES

SPOT RANGE - GULF OF MEXICO TO MIDDLE ATLANTIC STATES GEAR - HAUL SEINES, GILL NETS, POUND NETS, OTTER TRAWLS

SQUAWFISH RANGE - CALIFORNIA GEAR - FYKE NETS, GILL NETS

STEELHEAD TROUT RANGE - OREGON TO ALASKA GEAR - HAUL SEINES, POUND NETS, GILL NETS, LINES, DIP NETS

STRIPED BASS
RANGE - NORTH CAROLINA TO NEW ENGLAND, CALIFORNIA
TO OREGON
GEAR - HAUL SEINES, GILL NETS, POUND NETS,
HANDLINES, FYKE NETS

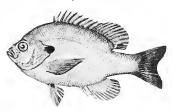

STURGEON RANGE - COASTAL AND RIVER AREAS GEAR - GILL NETS, LINES

STURGEON, SHOVELNOSE RANGE - FRESH-WATER GEAR - HAUL SEINES, LINES, POUND NETS

SUCKER RANGE - FRESH-WATER GEAR - POUND NETS, FYKE NETS, GILL NETS, HAUL SEINES, TRAP NETS

SUNFISH RANGE - FRESH-WATER GEAR - POTS, SEINES, TRAP NETS

SWELLFISH
RANGE - CHESAPEAKE BAY TO MIDDLE ATLANTIC
GEAR - POUND NETS, HAUL SEINES, OTTER TRAWLS

SWORDFISH RANGE - NEW ENGLAND AND CALIFORNIA GEAR - HARPOONS

TAUTOG RANGE - CHESAPEAKE BAY TO NEW ENGLAND GEAR - POUND NETS, HANDLINES, POTS

TENPOUNDER RANGE - FLORIDA GEAR - HAUL SEINES

THIMBLE-EYED MACKEREL RANGE - CHESAPEAKE BAY TO NEW ENGLAND GEAR - POUND NETS, PURSE SEINES, OTTER TRAWLS

TILEFISH
RANGE - MIDDLE ATLANTIC AND NEW ENGLAND STATES
GEAR - LONGLINES, REEF NETS, OTTER TRAWLS

TOMCOD

RANGE - PACIFIC COAST, MIDDLE ATLANTIC AND

NEW ENGLAND STATES

GEAR - OTTER TRAWLS, DIP NETS

TRIGGERFISH RANGE - FLORIDA GEAR - HANDLINES

TRIPLETAIL
RANGE - FLORIDA
GEAR - HAUL SEINES, GILL NETS, LINES

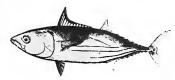

TUNA, ALBACORE RANGE - PACIFIC COAST GEAR - LINES

TUNA, BLUEFIN
RANGE - CALIFORNIA, NEW JERSEY TO MAINE
GEAR - PURSE SEINES, LAMPARA NETS, TROLL LINES,
POUND NETS, HARPOONS

TUNA, LITTLE
RANGE - MASSACHUSETTS TO TEXAS
GEAR - POUND NETS, TROLL LINES, OTTER TRAWLS

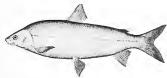

TUNA, SKIPJACK RANGE - CALIFORNIA GEAR - LINES AND PURSE SEINES

TUNA, YELLOWFIN RANGE - PACIFIC GEAR - LINES AND PURSE SEINES

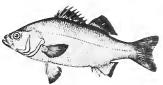

WHITE BASS
RANGE - GREAT LAKES
GEAR - TRAP NETS, FYKE NETS, HAUL SEINES,
POUND NETS

WHITEFISH, COMMON RANGE - GREAT LAKES GEAR - GILL NETS, POUND NETS, TRAP NETS

WHITEFISH, MENOMINEE RANGE - ALASKA, GREAT LAKES GEAR - GILL NETS, HAUL SEINES, TRAP NETS, POUND NETS

WHITE PERCH RANGE - NORTH CAROLINA TO MAINE GEAR - POUND NETS, FYKE NETS, HAUL SEINES

WHITING RANGE - VIRGINIA TO MAINE GEAR - OTTER TRAWLS, POUND NETS

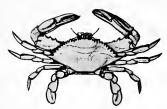

WOLFFISH RANGE - MASSACHUSETTS AND MAINE GEAR - OTTER TRAWLS, LONGLINES

YELLOW PERCH RANGE - GREAT LAKES, OTHER LAKES GEAR - GILL NETS, TRAP NETS, POUND NETS, FYKE NETS

YELLOW PIKE RANGE - GREAT LAKES GEAR - POUND NETS, FYKE NETS, GILL NETS, TRAP NETS

BLUE CRAB RANGE - TEXAS TO RHODE ISLAND GEAR - TROTLINES, POTS, FYKE NETS, DIP NETS, SCRAPES, DREDGES

DUNGENESS CRAB RANGE - PACIFIC COAST STATES AND ALASKA GEAR - TRAPS

KING CRAB RANGE - ALASKA GEAR - DTTER TRAWLS

ROCK CRAB RANGE - NEW ENGLAND GEAR - POTS

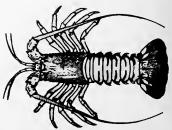

STONE CRAB RANGE - FLORIDA GEAR - DIP NETS, CRAB POTS

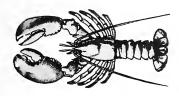

HORSESHDE CRAB RANGE - MARYLAND TO NEW YORK GEAR - POUND NETS, WEIRS, BY HAND

FRESH-WATER CRAWFISH RANGE - RIVERS AND LAKES GEAR - PDTS

SPINY LOBSTER RANGE - CALIFORNIA AND FLORIDA GEAR - DIP NETS, POTS, HOOKS

LOBSTER, NORTHERN
RANGE - VIRGINIA TO MAINE
GEAR - POTS, OTTER TRAWLS

SHRIMP
RANGE - TEXAS TO NORTH CAROLINA, MAINE,
CALIFORNIA, WASHINGTON, AND ALASKA
GEAR - SHRIMP TRAWLS

BUTTER CLAM RANGE - PACIFIC COAST GEAR - SHOVELS

LITTLE NECK CLAM RANGE - PACIFIC COAST GEAR - SHOVELS

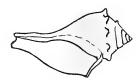

HARD CLAM RANGE - FLORIDA TO MAINE GEAR - HOES, DREDGES, TONGS, RAKES, BY HAND

RAZOR CLAM, PACIFIC RANGE - OREGON, WASHINGTON AND ALASKA GEAR - SHOVELS

SOFT CLAM RANGE - MIDDLE ATLANTIC TO NEW ENGLAND, PACIFIC COAST STATES GEAR - FORKS, HOES, RAKES, DREDGES

CONCH RANGE - FLORIDA TO MAINE GEAR - OTTER TRAWLS, DREDGES, POTS, AND BY HAND

LIMPET RANGE - NEW YORK AND NEW ENGLAND GEAR - DREDGES

FRESH-WATER MUSSEL RANGE - FRESH-WATER STREAMS GEAR - CROWFOOT BARS, PICKS, HAND

SEA MUSSEL RANGE - NORTH CAROLINA TO MAINE GEAR - DREDGES, TONGS, RAKES, HAND

OYSTER
RANGE - TEXAS TO MASSACHUSETTS, PACIFIC COAST
GEAR - TONGS, DREDGES, RAKES, BY HAND

BAY SCALLOP RANGE - FLORIDA TO MASSACHUSETTS, WASHINGTON GEAR - DREDGES, SCRAPES, PUSH NETS, TONGS, RAKES, DIP NETS

SEA SCALLOP RANGE - NEW JERSEY TO MAINE GEAR - DREDGES, OTTER TRAWLS

STARFISH RANGE - ATLANTIC AND PACIFIC COAST GEAR - HOOKS, SCRAPES, "MOPS"

TERRAPIN
RANGE - TEXAS TO NEW JERSEY
GEAR - HAUL SEINES, BY HAND

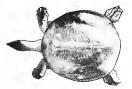

GREEN TURTLE RANGE - FLORIOA GEAR - GILL NETS

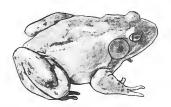

LOGGERHEAD TURTLE RANGE - FLORIDA TO NEW JERSEY GEAR - GILL NETS

HAWKSBILL TURTLE RANGE - GULF OF MEXICO, AND ATLANTIC COAST TO NEW YORK GEAR - BY HAND, POUND NETS

SOFT-SHELL TURTLE RANGE - LAKES AND RIVERS GEAR - HAUL SEINES, FYKE NETS, POTS

FROG RANGE - FRESH-WATER, MARSHES, POND GEAR - SPEARS, GRABS

SQUID

RANGE - VIRGINIA TO MAINE, CALIFORNIA AND
WASHINGTON
GEAR LAMPARA NETS, GILL NETS, OTTER TRAWLS,
FOUND NETS

SPONGE RANGE - FLORIDA GEAR - HOOKS, DIVING OUTFITS

IRISH MOSS RANGE - NEW ENGLAND GEAR - RAKES

## SECTION 16 - STATISTICAL PUBLICATIONS

The following list of publications includes all reports issued in the Current Fishery Statistics series during 1961.

```
C. F. S. NO. TITLE

C. F. S. NO. TITLE

2400 ALADAMA LADDINGS, SEPTEMBERS, 1900
2420 MISSISSIPPI RIVER FEDERALES, AMBUAL, 1959
2421 MISSISSIPPI RIVER FEDERALES, AMBUAL, 1959
2422 MISSISSIPPI LANDINGS, MOVEMBER, 1960

Created in 1849, the Department of the Interior.—America's Department of Natural Resources.—is concerned with the management, conservation, and development of the Nation's water, fish, wildlife, mineral, farest, and park recreational resources. It also has major responsibilities for Indian and Territorial affairs.

As the Notion's principal conservation agency, the Department works to assure that nonrenewable resources ore developed and used wisely, that park and recreational resources are conserved for the future, and that renewable resources make their full contribution to the progress, prosperity, and security of the United States--naw and in the future.

#### STATISTICAL PUBLICATIONS

An assemblage of the many statistical publications currently released by the Branch of Statistics, Bureau of Commercial Fisheries.
