NOAA TECHNICAL REPORTS

National Marine Fisheries Service, Special Scientific Report-Fisheries Series

The major responsibilities of the National Marine Fisheries Service (NMFS) are to monitor and assess the abundance and geographic distribution of fishery resources, to understand and predict fluctuations in the quantity and distribution of these resources, and to establish levels for optimum use of the resources and to establish levels for optimum use of the resources and so charged with the development and implementation of policies for managing national fishing grounds, development and enforcement of domestic fisheries regulations, surveillance of foreign fishing off United States coastal waters, and the development and enforcement of international fishery agreements and policies. NMFS also assists the fishing industry through marketing service and economic analysis programs, and mortgage insurance and vessel construction subsidies. It collects, analyzes, and publishes statistics on various phases of the industry.

The Special Scientific Report. Fisheries series was established in 1949. The series carries reports on scientific investigations that document long term continuing programs of NMFS, or intensive scientific reports on studies of restricted scope. The reports may deal with applied fishery problems. The series is also used as a medium for the publication of bibliographies of a specialized scientific nature.

NOAA Technical Reports NMFS SSRF are available free in limited numbers to governmental agencies, both Federal and State. They are also available in exchange for other scientific and technical publications in the marine sciences. Individual copies may be obtained (unless otherwise noted) from D83, Technical Information Division, Environmental Science Information Center, NOAA, Washington, D.C. 20235. Recent SSRF's are

Summer Benthic Fish Fauna of Sandy Hook Bay, New Jersey

STUART J. WILK and MYRON J. SILVERMAN1

ABSTRACT

Thirty-eight species and 25 families of fishes were captured during an otter trawl survey in Sandy Hook Bay, N.J., during July to October 1970. Distribution, abundance, length and age composition, and environmental preferences were analyzed for the more numerous species. Winter flounder, Pseudopleuronectes americanus; striped searobin, Prionotus evolans; windowpane, Scophthalmus aquosus; and northern searobin, Prionotus carolinus, accounted for 68.3% by number and 66.4% by weight of the total survey catch.

INTRODUCTION

Historically, Sandy Hook Bay has supported commercial fisheries since the early days of settlement in the United States (True 1887). Within the past half century, water quality has deteriorated largely from sewage (Federal Water Pollution Control Administration 1967) and industrial waste contamination, and much of the bay bottom is now unfit for shellfish harvest. Only a few pound nets and purse seines are currently operated in the bay, but year-round and seasonally intensive small boat and shore recreational fisheries have developed. The following report of a systematic trawl survey of finfish is the first of several to be undertaken in Sandy Hook Bay, and provides baseline observations for future comparison of biological and environmental changes in the area.

Otter trawl hauls were made from July to October 1970 to determine summer species composition, relative abundance, and distribution of benthic fishes in Sandy Hook Bay. All catch data are summarized, together with length-frequency data and estimates of age composition and summer growth rates based on published age-length information.

DESCRIPTION OF STUDY AREA

Sandy Hook Bay is bounded on the north by Lower Bay, on the south and west by the New Jersey mainland, from which it receives drainage of the Navesink and Shrewsbury rivers, and on the east is separated from the Atlantic Ocean by Sandy Hook peninsula. To establish uniform sampling areas, the bay was divided into 18 blocks (Fig. 1). Except where interrupted by land, each block measured 1' lat. × 1' long., i.e., 1.8 km × 1.4 km (1.0 × 0.75 nautical mile).

MATERIALS AND METHODS

All 18 blocks were sampled, as close to biweekly as possible, during 2-day cruises when weather conditions and vessel scheduling permitted.

Our vessel was the Middle Atlantic Coastal Fisheries Center's Martha-E II, a 10.4-m (34-foot) diesel-powered research vessel equipped with hydraulic trawl winch, trawl boom, electronic navigation equipment, and electronic depth recorders.

'Middle Atlantic Coastal Fisheries Center Sandy Hook Laboratory, National Marine Fisheries Service, NOAA, Highlands, NJ 07732.

At each sampling station, surface and bottom temperature and salinity were measured with a portable thermometer-salinometer probe. Station depth, bottom contours, and fish concentrations were observed with white-line fathometers aboard the vessel. The otter trawl was towed for 10 min at approximately 5.6 km/h (3 knots) in each sample block. The two-seam trawl used had the following dimensions: 9.1-m (30-foot) footrope and 7.6-m (25-foot) headrope; 64-mm (2.25-inch) stretched mesh 18-thread knotted nylon in the body of the trawl and 51-mm (2-inch) stretched mesh 18-thread knotless nylon in the cod end. During each trawl tow, frequent navigational checks were made to remain within a sample block. Although towing time remained constant, both direction and distance of the tow were governed by tide, current, wind, and starting location.

At the conclusion of each tow, the trawl was retrieved and emptied on the afterdeck of the vessel, where the fishes were sorted and identified. All specimens of each species were weighed and a random sample of 20-25 specimens measured to the nearest centimeter (total length). Usually, all specimens of each species were counted; but, when a species was very numerous, an estimate of the total was made by counting and weighing the fish in a subsample.

Physical and biological data collected were recorded on punch cards and subsequently sorted, mapped, and analyzed by computer.

Common and scientific names used follow those listed by the American Fisheries Society (Bailey et al. 1970).

RESULTS

During the 3.5-mo study, 112 station blocks were occupied on 15 sample dates. Data were grouped into eight sample periods of seven 2-day cruises and one 1-day cruise.

The results of our collections are presented as follows:

- 1. List of bottom temperature, salinity, and depth observed at each otter trawl station, including summary data on station blocks and sample periods (Table 1).
- 2. List of species caught in descending order of abundance, including summaries of each species and sample period (Appendix Table 1).
- 3. Phylogenetic list summarizing all parameters for each species (Appendix Table 2).
- 4. Maps of the average number and weight of all fish caught per 10-min tow (Figs. 2, 3).
- 5. Maps of the distribution of average catch (no.) per 10-min tow for 10 of the most numerous species (Figs. 4-13).

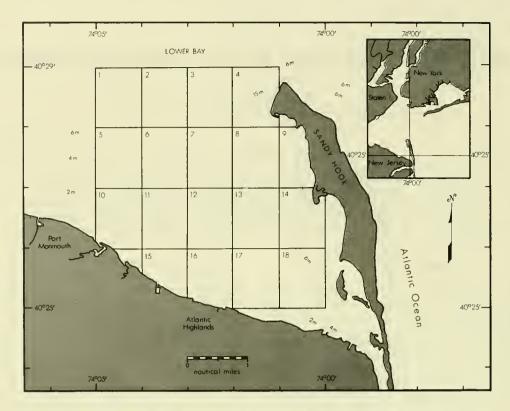

Figure 1.-Outline of Sandy Hook Bay, N.J., divided into 18 blocks where finfish were sampled during an otter trawl survey, July to October 1970.

6. Length-frequency distributions representing the size distribution and changes in the size composition during the survey of eight species (Figs. 14-21).

SUMMARY

Four species-winter flounder, Pseudopleuronectes americanus; striped searobin, Prinonotus evolans; windowpane, Scophthalmus aquosus; and northern searobin, Prionotus carolinus-accounted for 68.3% by number and 66.4% by weight of the total catch during the survey. Although 10 of the most abundant species accounted for 95.0% by number and 84.6% by weight of the total catch, only seven species occurred in more than 25% of the collections (Appendix Table 1).

Catches in the northern half of Sandy Hook Bay (station blocks 1-9) contained a total of 35 species; those in the southern half (station blocks 10-18) 22 species (Appendix Table 2). The total catch both by weight and number in the northern half exceeded that of the southern half (Figs. 2, 3). The greater abundance and diversity of species in the northern half of the survey area were believed to be related to the deeper and slightly colder water found there (Table 1)

and proximity to the ocean (Fig. 1).

The bay appears to provide a summer residence for several important recreational and commercial species, primarily red hake, Urophycis chuss; bluefish, Pomatomus salatatrix; scup, Stenotomus chrysops; weakfish, Cynoscion regalis; butterfish, Peprilus triacanthus; summer flounder, Paralichthys dentatus; and winter flounder, Pseudopleuronectes americanus (Appendix Table 2).

Smallmouth flounder Etropus microstomus	Sept.	5 6		12.0		21.8 18.8		27.7 26.2		4.6 9.1	
Summer flounder Paralichthys	July	2-4,6-10, 12-16	32- 49	39.5	18.4-23.3	21.5	25.0-27.3	26.4	2.7-12.2	6.9	Judging from growth data given by Smith (1969), our samples were
dentatus	Aug.	1-3,5-9,	35- 51	40.3	23.0-25.4	24.0	25.8-28.0	27.2	2.4-12.2	6.4	composed of fish 2-5 years old. This species is one of the most
	Sept. Oct.	2-7,9,12 5	29- 47 	39.4 40.0	20.4-22.4	21.3 19.0	27.0-29.4	28.2 27.1	5.2-13.4	7.5 5.8	sought after by sportsmen in the area.
indowpane	July	2-8,12, 13,15	7- 31	21.7	18.4-22.9	21.0	25.9-27.3	26.6	4.3-12.2	7.8	Most windowpane (97.8%) were taken in northern half of survey area;
aquosus	Aug.	1-9,13,	7- 28	14.6	22.7-25.4	23.8	26.8-28.0	27.4	4-6-12-2	6.5	85.6% in blocks 3, 4, and 7 (Fig. 12).
	Sept.	1-4,6,7,	9- 29	18.5	20.5-22.4	21.5	27.5-29.4	28.3	2.4- 9.8	7.0	
	Oct.	14 1,2,5-7, 12,13,15	12- 25	18.2	18.0-19.2	18.8	25.9-27.1	26.4	2.4- 9.8	7.0	Based on growth data given by Moore (1947) and monthly length-frequencies (Fig. 20), July catches were probably composed mainly of 4- and 5-year-old fish. In later months, 2- and 3-year olds predominated.
											Windowpane preferred the cooler and deeper waters found in the northern half of the survey area. All catches of more than 35 specimens, i.e., 77.7% of the total catch, were made in water which averaged nearly 4 m deeper and 1°C cooler than the survey average.
Winter flounder Pseudopleuronectes americanus	July Aug. Sept.	2-9,11-18 1-9,11-14 1-4,6-10,	10- 37 11- 34 10- 36	21.3 20.8 21.9	18.4-22.2 23.0-24.9 20.4-22.5	23.8	25.8-27.3 26.8-28.0 26.7-29.5	27.4	2.4-10.7 2.4-12.2 2.4-13.4	6.4 6.3 7.0	Winter flounder occurred in all blocks. Heaviest catches in northern half of bay; 78.28 in
	12,14 Oct. 1,5-7, 10-13, 15,16	11- 32	20.2	18.0-19.4	18.8	25.6-27.1	26.2	2.4- 9.8	6.0	blocks 3, 4, 6, and 7 (Fig. 13). Judging from data given by Bigelow and Schroeder (1953) and Lux (1973) and monthly length-frequencies (Fig. 21), the measured specimens were 1-4 years of age.	
											Catches of over 100 individuals were all made in the 6.7- to 11.0-m depth range; the mean depth in which these larger catches were made is 2.8 m greater than the survey average.
Orange filefish Aluterus schoepfi	Oct.	6		32.0		18.8		26.2		9.1	Both species of filefish are rather common in general area during summer and fall (Nichols and Breder 1927).
Planehead filefish Monocanthus hispidus	Sept.	4	10- 11	10.5		22.4		28.2		11.6	
orthern puffer Sphoeroides maculatus	July Aug. Sept.	4 4-7 4,6,7,9	6- 8 9- 27	21.0 7.0 18.5	23.5-24.4 20.6-22.4	22.9 23.9 21.3	26.8-28.0 28.1-28.8	26.2 27.4 28.3	3.7-12.2 5.8-11.6	7.0 7.2 7.3	All specimens taken in northern half of survey area.
Striped burrfish Chilomycterus schoepfi	Oct.	6		10.0		18.8		26.2		9.1	This species, according to Bigelow and Schroeder (1953) and Nichols and Breder (1927), is an occasional summer visitor to New Jersey waters

- 648. Weight loss of pond raised channel catfish (Ictalurus punctotus) during holding in processing plant vats. By Donald C. Greenland and Robert L. Gill. December 1971, ui + 7 p., 3 figs., 2 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 649. Distribution of forage of skipjack tuna (Euthynnus pelamis) in the eastern tropical Pacific By Maurice Blackburn and Michael Laurs. January 1972. ii + 16 p., 7 figs., 3 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C 20402
- 650. Effects of some antioxidants and EDTA on the development of rancidity in Spanish mackerel (Scomberomorus maculatus during frozen storage. By Robert N. Farragut. February 1972, iv. + 12 p., 6 figs., 12 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 651 The effect of premortem stress, holding temperatures, and freezing on the biochemistry and quality of skippeck tuna. By Ladell Crawford April 1972, in + 23 p., 3 figs. 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington D.C. 20402.
- 653. The use of electricity in conjunction with a 12.5-meter (Headrope) Gulf of Mexico shrimp trawl in Lake Michigan. By James E. Ellis, March 1972, iv + 10 p., 11 figs., 4 tables, For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 654 An electric detector system for recovering internally tagged menhaden, genus Brevoortia. By R. O. Parker, Jr. February 1972, \pm ii + 7 p., 3 figs., 1 appendix table. For sale hy the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 855. Immohilization of finerling salmon and trout by decompression. By Duyle F. Sutherland. March 1972, iii. + 7 p., 3 figs., 2 tables. For sale by the Sutherland of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 656. The calico scallop, Argopecten gibbus. By Donald M. Allen and T. J. Costello, May 1972, in + 19 p., 9 figs., 1 table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 657 Making fish protein concentrates by enzymatic hydrolysis. A status report on research and some processes and products studied by NMFS. By Malcolm B. Hale November 1972, v + 32 p., 15 figs., 17 tables, 1 appendix table. For sale by the Superintendent of Documents, U S. Government Printing Office, Washington, D.C. 20402
- 658. List of fishes of Alaska and adjacent waters with a guide to some of their literature. By Jay C. Quast and Elizabeth f., Hall, July 1972, iv. + 47 p. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 659. The Southeast Fisheries Center bionumeric code Part 1: Fishes. By flarvey R. Bullis, Jr., Richard B. Roe, and Judith C. Gathin, July 1972, xl + 95 p., 2 figs. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 660. A freshwater fish electro-motivator (FFEM) its characteristics and operation. By James E. Ellis and Charles C. Hoopes, November 1972, iii + 11 p., 9 figs.
- 661. A review of the literature on the development of skipjack tuna fisheries in the central and western Pacific Ocean. By Frank J. Hester and Tamio Otsu. January 1973, ni + 13 p., 1 fig. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 662. Seasonal distribution of tunas and billfishes in the Atlantic. By John P. Wise and Charles W. Davis. January 1973, iv + 24 p., 13 figs., 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 663. Fish larvae collected from the northeastern Pacific Ocean and Puget Sound during April and May 1967. By Kenneth D. Waldron. December 1972, iii + 16 p., 2 figs., 1 table, 4 appendix tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington D.C. 20402.
- 664. Tagging and tag-recovery experiments with Atlantic menhaden, Brevoortic tyrannus. By Richard L. Kroger and Robert L. Dryfoos. December 1972, iv + 11 p., 4 figs., 12 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 665. Larval fish survey of Humbolt Bay, California. By Maxwell B. Eldrige and Charles F. Bryan. December 1972, iii + 8 p., 8 figs., 1 table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

- 666. Distribution and relative abundance of fishes in Newport Biver, North Carolina By William B. Turner and George N. Johnson. September 1973, iv + 25, p. 1 fig. 13 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 667. An analysis of the commercial lobster (Homarus americanus) fishery along the coast of Maine, August 1966 through December 1970. By James C. Thomas. June 1973, v + 57 p., 18 figs., 11 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 668 An annotated bibliography of the cunner, Toutogolabrus adspersus (Walbaum) By Fredric M. Serchuk and David W. Frame, May 1973, ii + 43 p. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 669. Subpoint prediction for direct readout meterological satellites. By L. E. Eber, August 1973, m+7 p., 2 figs., 1 table. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 670. Unharvested fishes in the U.S. commercial fishery of western Lake Erie in 1969. By Harry D. Van Meter, July 1973, iii + 11 p., 6 figs., 6 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 671. Coastal upwelling indices, west coast of North America, 1946-71. By Andrew Bakun, June 1973, iv + 103 p., 6 figs., 3 tables, 45 appendix figs. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 672 Seasonal occurrence of young Gulf menhaden and other fishes in a northwestern Florida estuary. By Marlin E. Tagatz and E. Peter H. Wilkins. August 1973, iii + 14 p., 1 fig., 4 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 673. Abundance and distribution of inshore benthic fauna off southwestern Long Island, N.Y. By Frank W. Steimle, Jr. and Richard B. Stone. December 1973, iii + 50 p., 2 figs., 5 appendix tables.
- 674. Lake Erie bottom trawl explorations, 1962-66. By Edgar W. Bowman, January 1974, ν + 21 p., 9 figs., 1 table, 7 appendix tables.
- 675. Proceedings of the International Billfish Symposium, Kailua-Kona, Hawaii, 912 August 1972. Part 2. Review and Contributed Papers. Richard S. Shomura and Francis Williams teditors). July 1974, iv + 335 p., 38 papers. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 676. Price spreads and cost analyses for finfish and shellfish products at different marketing levels. By Erwin S. Penn. March 1974, vi + 74 p., 15 figs., 12 tables, 12 appendix figures, 41 appendix tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 677. Abundance of benthic macroinvertebrates in natural and altered estuarine areas. By Gill Gilmore and Lee Trent. April 1974, iii + 13 p., 11 figs., 3 tables, 2 appendix tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 678. Distribution, abundance, and growth of juvenile sockeye salmon, Oncorhynchus nerka, and associated species in the Naknek River system, 1961-64. By Robert J. Ellis. September 1974, v + 53 p., 27 figs., 28 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 679. Kinds and abundance of zooplankton collected by the USCG icebreaker Glacier in the eastern Chukchi Sea, September-October 1970. By Bruce L. Wing, August 1974, iv + 18 p., 14 figs., 6 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 680. Pelagic amphipod crustaceans from the southeastern Bering Sea, June 1971. By Gerald A. Sanger. July 1974, iii + 8 p., 3 figs., 3 tables. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 681. Physiological response of the cunner, Toutogolabrus adspersus, to cadmium. October 1974, iv + 33 p., 6 papers, various authors. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.
- 682. Heat exchange between ocean and atmosphere in the eastern North Pacific for 1961-71. By N. E. Clark, L. Eber, R. M. Laurs, J. A. Renner, and J. F. T. Saur. December 1974, iii + 108 p., 2 figs., 1 table, 5 plates.
