**SPECIAL SCIENTIFIC REPORT: FISHERIES No.73**

**UNITED STATES DEPARTMENT OF THE INTERIOR  
FISH AND WILDLIFE SERVICE**

## Explanatory Note

The series embodies results of investigations, usually of restricted scope, intended to aid or direct management or utilization practices and as guides for administrative or legislative action. It is issued in limited quantities for the official use of Federal, State or cooperating agencies and in processed form for economy and to avoid delay in publication.

ZOOPLANKTON VOLUMES OFF THE PACIFIC COAST, 1951

Prepared by

The Staff of the South Pacific Fishery Investigations  
U. S. Fish and Wildlife Service

Special Scientific Report: Fisheries No. 73

This report contains data on the volume of zooplankton collected on the monthly survey cruises of the California Cooperative Sardine Research Program during 1951. The cruises were numbered XXI through XXXII. Two to four vessels participated in each cruise. Participating vessels include the Horizon (Cruises XXI, XXIII through XXVI, XXXII), the Crest (Cruises XXI through XXXI), and the Paolina T. (Cruises XXVII through XXX) of the Scripps Institution of Oceanography; the N. B. Scofield (Cruise XXI) and the Yellowfin (Cruises XXVI, XXXII) of the California Department of Fish and Game, and the Black Douglas (Cruises XXII through XXXI) of the U. S. Fish and Wildlife Service.

The plankton samples are being collected for the twofold purpose of studying pilchard or sardine, Sardinops caerulea, "recruitment" and the productivity of pilchard spawning areas. The "recruitment" research is being carried out by the U. S. Fish and Wildlife Service; the productivity studies by the Scripps Institution of Oceanography. Both facets of the research are directed toward determining the factors affecting the survival rates of pilchard eggs and larvae.

The nets employed in collecting the plankton samples were constructed of No. 30xxx grit gauze, a heavy-duty grade of silk bolting cloth. The opening between meshes of this grade of grit gauze is approximately 0.65 mm. The nets were conical in shape, 1.0 meter in diameter at the mouth by approximately 5 meters in length.

A similar procedure for taking plankton hauls was followed on all vessels. The hauls were made obliquely from approximately 140 meters deep to the surface (200 meters of wire out at greatest depth) whenever the depth of water permitted. Hauls taken at shallower depths are so indicated in the tables. At all stations, a current meter was used in the mouth of the net to register the flow of water into the net.

At a moderate number of stations, deeper tows were made in addition to the routine ones. Usually at such stations, 600 meters of wire was payed out and retrieved. The data for such hauls are grouped together on the last page of the following tables.

In determining plankton volume, the plankton was separated from its preserving liquid by filtering, allowed to drain, and then its volume was determined by displacement. Consequently, the volume measured is "wet" volume.

In the following tables the plankton volume is given under four headings: (1) Total displacement volume of plankton taken, (2) volume of "smaller" organisms remaining when jelly masses, large mollusca, fish, larger squid, and the like, were removed, (3) total volume standardized in the amount present in 1000 cubic meters of water, and (4) a similar value for the smaller organisms.

For each haul are given also the location, date and time of collection, and volume of water strained in obtaining the haul. The volume of water strained was determined from current meter readings for all values except the few enclosed by parentheses, for which reliable current meter data were lacking. For the latter, an approximate value was obtained which represented the average performance of the current meter at the speed at which the hauls in question were taken.

Inasmuch as plankton samples vary greatly in composition, a small sample composed predominantly of crustacean plankton may actually represent more potential food material than a large sample composed largely of jelly-like organisms, such as salps. This fact should be kept in mind when using these data.

These investigations are part of the California Cooperative Sardine Research Program, a program sponsored by the Marine Research Committee and being carried out by the Scripps Institution of Oceanography, the California Department of Fish and Game, the California Academy of Sciences, the Hopkins Marine Station of Stanford University, and the South Pacific Fishery Investigations of the U. S. Fish and Wildlife Service.

The first part of the book deals with the early years of the nation, from the time of the first settlers to the end of the American Revolution. It covers the period from 1607 to 1789, and is divided into three volumes. The first volume covers the years 1607 to 1700, the second volume covers the years 1700 to 1775, and the third volume covers the years 1775 to 1789. The second part of the book deals with the years from 1789 to 1860, and is also divided into three volumes. The fourth volume covers the years 1789 to 1800, the fifth volume covers the years 1800 to 1825, and the sixth volume covers the years 1825 to 1860. The third part of the book deals with the years from 1860 to 1900, and is also divided into three volumes. The seventh volume covers the years 1860 to 1875, the eighth volume covers the years 1875 to 1890, and the ninth volume covers the years 1890 to 1900. The fourth part of the book deals with the years from 1900 to the present, and is also divided into three volumes. The tenth volume covers the years 1900 to 1914, the eleventh volume covers the years 1914 to 1945, and the twelfth volume covers the years 1945 to the present.
