UNITED STATES FOREIGN TRADE IN EDIBLE FISHERY PRODUCTS, 1949-53

By Arthur M. Sandberg* and Ruth L. Dunavant**

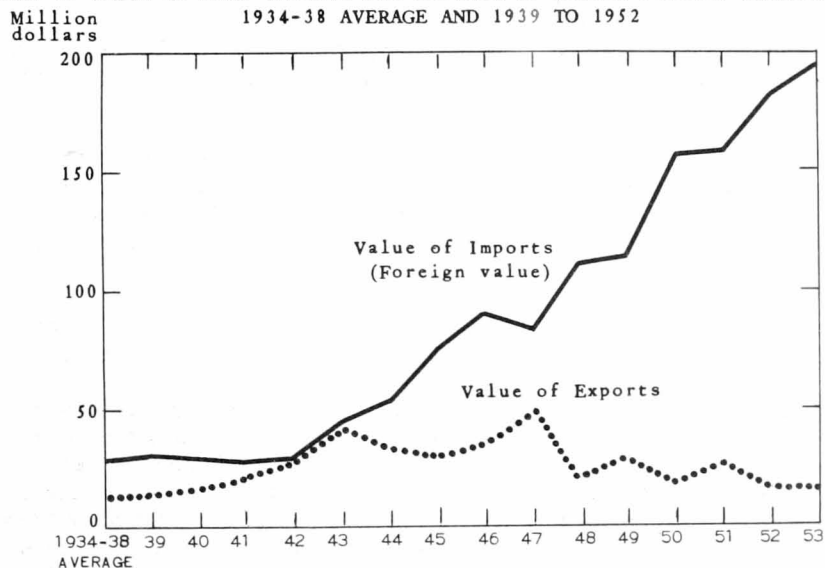

INTRODUCTION

Definite changes are shown in the pattern of United States foreign trade in edible fishery products during the post-war period, 1949-53. Since 1949, the volume of imports has increased rapidly, reaching record levels in 1953. Exports, which were at a relatively high level in 1949, dropped to a record low in 1953, substantially below the levels of the depression years 1932 and 1933.

Imports of edible fishery products in 1953 were more than double the quantity of the annual average of such imports during the prewar period 1934-38. Among the major items showing substantial increases over the prewar average were fresh and frozen tuna, canned tuna and tunalike fish, and fresh and frozen fillets. Exports of edible fishery products in 1953 were 29 percent below their prewar average in quantity. Canned salmon and sardine exports were the principal items accounting for this decline.

The quantity and value of edible fishery products imported into and exported from the United States annually from 1939 through 1953 compared with the 1934-38 average are graphically illustrated in chart 1 (front cover) and chart 2.

CHART 2.-VALUE OF U.S. IMPORTS AND EXPORTS OF EDIBLE FISHERY PRODUCTS,
1934-38 AVERAGE AND 1939 TO 1952

*Commodity-Industry Analyst **Statistical Assistant
Economics and Cooperative Marketing Section, Branch of Commercial Fisheries

United States imports of edible fishery products during 1953 totaled \$195,209,660, foreign value^{1/}, or almost 7 times the value of the 1934-38 average. The value of exports of edible fishery products in 1953 was 28.6 percent above the prewar average. The quantity and value of these imports and exports for the years 1949-53 compared with the prewar (1934-38) average are shown in table 1.

The importance of United States foreign trade in fishery products to the domestic fishery economy can perhaps be more readily grasped by a comparison with the domestic catch. The United States and Alaska fisheries produced in 1953, a catch of about 2.6 billion pounds, round weight, of fish for edible purposes. Imports of edible fishery products in 1953, when converted to a round weight equivalent, represented a catch of more than 1 $\frac{1}{4}$ billion pounds, or equivalent to 49 percent of the domestic catch used for edible purposes. Stated in yet another way, the 1953 imports represent about one-third of total United States consumption of edible fishery products.

Foreign markets for United States fishery products have provided important outlets for edible products. Export markets have required up to 14 percent of the domestic catch of fish used for edible purposes. In 1953, about 5 percent of the United States catch used for edible purposes was exported or went into the manufacture of edible fishery products ultimately sold abroad.

The major competitors for the United States domestic trade in fishery products are Canada, Norway, Iceland, Mexico, Japan, Portugal, Peru, and the Union of South Africa.

Rehabilitation of the world fisheries after the end of the war brought rapid recovery to prewar catch levels generally occurring about 1948 in almost all areas except the Far East. Since that time, fisheries were subjected to certain settling influences. For instance, fillet production in Canada and Iceland which developed to supply wartime requirements for the United Kingdom and other Western European countries was directed toward the United States market after the emergency needs of World War II diminished. Japan promptly resumed and increased its trade in tuna with the United States. But for reasons of change in fishing areas and lack of supply,

^{1/} Market value or price in the country of exportation including costs of usual containers and charges incidental to placing the merchandise at the port of exportation ready for shipment to the United States. Virtually all fishery products are valued on basis of foreign value.

Japan was not able to resume the salmon and pilchard trade it enjoyed in prewar years. Failure of the United States pilchard catch has resulted in recent gains in imports of canned sardines from Japan, the Union of South Africa, and the Netherlands.

Foreign-aid programs were redirected under the Marshall Plan beginning in 1948. From that time through 1953, most Western European countries as well as others controlled the commodities for which dollar exchange could be used. This resulted in an almost complete curtailment of the exports of United States canned fish to the United Kingdom and other Western European Countries. Export markets in the Far East absorbed most of the surplus of canned sardines. A decline in the canned salmon pack in the United States after 1949 forestalled any large exportable surplus of this commodity. In 1953, the United States imported substantial quantities of canned salmon and sardines to meet its own requirements.

SUMMARY OF UNITED STATES IMPORTS

United states imports of edible fishery products in 1953 totaled 726,179,000 pounds valued at \$195,210,000 (table 2). The 1953 imports exceeded those of any year on record, both in quantity and value. Fresh and frozen fish imports were almost three times the quantity of those of the 1934-38 average. Canned fish imports were more than double those of the prewar average. Fresh and frozen shellfish imports were more than three times the 1934-38 average. Cured fish imports were slightly less than the prewar average. Fresh and frozen fish and shellfish together accounted for 67 percent of the total quantity of imports of edible fishery products.

Canada was the source of a large percentage of United States imports of fresh and frozen fish. Western Europe was the principal source of canned fish. Africa became an increasing supplier of canned fish in 1953. Japan continued to be an important source of frozen and canned fishery products.

SUMMARY OF UNITED STATES EXPORTS

Exports of edible fishery products from the United States in 1953 totaled 69,308,000 pounds, valued at \$17,084,000. Fresh and frozen fish exports were about equal in quantity to the annual average of 1934-38 (table 3). Canned fish exports were almost half the prewar period and about a third of the quantity exported in 1949-51. Canned shellfish exports however in 1953 were almost double those of 1934-38 due principally to greater shipments of canned squid. Cured fish and shellfish exports were about one-third of prewar.

Canned fish and shellfish made up 83 percent of United States exports of edible fishery products in 1953. The principal export destination was the Philippines.

IMPORTS OF FRESH AND FROZEN FISH AND SHELLFISH

United States imports of fresh and frozen fish in 1952 reached the highest quantity on record. The 1953 imports were second only to those of 1952. Tuna, salmon and groundfish (cod, haddock, hake, pollock, cusk, and ocean perch) were the principal fresh and frozen items imported in substantially greater volume than the annual average of 1934-38 (table 4, page 6). Halibut and swordfish were also received in increased quantities.

Practically all the sea herring and tuna imported are raw materials for canning, whereas most of the other items go directly into markets as fresh or frozen fish. Imports of groundfish until 1953 were largely of fresh and frozen fillets. Late in 1953, however, fish blocks of cod and related species (skinless fillets compressed into a single block) were introduced for use in the preparation of fish sticks and other portioned fish. Large quantities of fresh-water fish were imported as fillets also.

1/ Cod, haddock, hake, pollock, cusk, ocean perch, filleted, skinned, boned, sliced, or divided were included with "Other" species prior to 1939.

Source: Compiled from U. S. Bureau of the Census data.

Canada was the leading country in the shipment of fresh and frozen fish to the United States (table 5, page 7). Japan and Iceland were also major suppliers in 1953. Tuna imports increased substantially coming largely from Japan and Peru. Imports of salmon from Canada also show large gains over the prewar (1934-38) average. Swordfish imports, both whole and as fillets showed gains both from Japan and from Peru. Groundfish fillets (cod, haddock, hake, pollock, cusk, and ocean perch) increased from about 47 million pounds in 1949 to almost 90 million pounds in 1953, due to greater imports from Iceland, Norway, and Canada. Other fillets, largely fresh-water fish fillets from Canada and swordfish fillets from Japan, increased from 18 million pounds in 1949, to 51 million pounds in 1953 (see chart 3, page 7).

Grand total.....	132,899	242,226	343,678	372,920	400,418	383,765

1/ Included are small quantities of various fresh-water fish principally from Mexico and Denmark.

2/ Includes with fins removed and without fins removed.

3/ Includes 1,110,000 pounds from U. S. S. R.

4/ Data for 1951 and subsequent years exclude tuna caught by U. S. fishing vessels and transhipped from Costa Rica and the Canal Zone. Up to 1951 official statistics of imports included large quantities of tuna caught by such vessels.

5/ Prior to 1939 cod, haddock, hake, pollock, cusk and ocean perch filleted, skinned, boned, sliced or divided were included with "Other fresh and frozen."

Note: As a result of Confederation, imports from Canada in and subsequent to 1950 included Newfoundland and Labrador. To make statistics for prior years comparable imports from Newfoundland and Labrador have also been included with Canada.

Source: Compiled from U. S. Bureau of the Census data.

Imports of fresh and frozen shellfish reached the highest volume on record in 1953 (table 6, page 11). Lobster imports, largely from Canada, were about $3\frac{1}{2}$ times those of the annual average of 1934-38 (table 7, page 12). Shrimp imports, principally from Mexico, were about 23 times those of the prewar period. Lobsters made up 40 percent of total shellfish imports; shrimp, 41 percent.

Lobster imports from the Union of South Africa, New Zealand, and Australia show large gains over the prewar average. Shrimp imports, principally from Panama, and other Latin American countries show significant increases in recent years. (Chart 4, page 11).

EXPORTS OF FRESH AND FROZEN FISH AND SHELLFISH

The United States exports of fresh and frozen fish and shellfish in 1953 totaled 10,385,000 pounds (table 8, page 14). Canada was the principal foreign destination for these products in 1953, taking 36 percent of the fish and 87 percent of the shellfish exports (table 9, page 16). Generally fresh and frozen salmon and oyster exports were far below those of the prewar average (1934-38). Shrimp exports decreased to about half the 1934-38 average.

IMPORTS OF CANNED FISH AND SHELLFISH

United States imports of canned fish and shellfish exceeded prewar levels in 1950 and since that time have increased to twice the 1934-38 average in quantity. The increase in 1953 canned fish imports is accounted for largely by gains in sardines, tuna, and salmon (table 10). The 1953 imports were equivalent to 18 percent of domestic production of canned fishery products (appendix, table A).

Table 10.-United States Imports for Consumption of Canned Fishery Products, by Kind of Product, 1934-38 Average and 1949-53

1/ Includes herring.

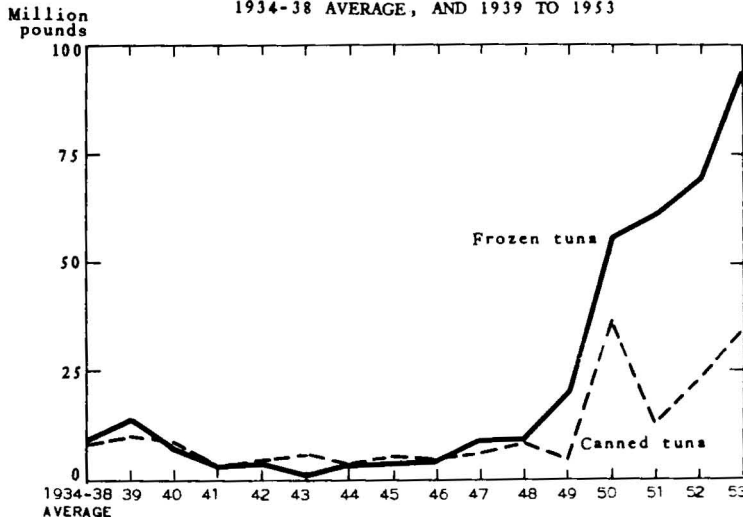

2/ Imports of abalone were not reported separately prior to 1943 but were included with other shellfish, fresh and frozen.

Source: Compiled from U. S. Bureau of the Census data.

Increased imports of canned sardines in 1953 were obtained principally from the Union of South Africa and from Japan (table 11, page 20). These products were imported to fill a gap created by the short domestic packs of sardines. Imports of Norwegian sardines in 1953 were below the annual average of 1934-38. Portuguese sardines were imported in 1953 in greater quantities than in the prewar period (See chart 5).

Canned salmon imports in 1953 were over four times those of the annual average in 1934-38. Imports came principally from Canada. A reduction in import duty in 1952 and a small domestic pack of canned salmon were the principal reasons for this gain.

CHART 5.—UNITED STATES IMPORTS OF FROZEN AND CANNED TUNA, 1934-38 AVERAGE, AND 1939 TO 1953

Imports of canned tuna were over five times those of the annual average of 1934-38, due principally to increased imports from Peru and Japan (See chart 6). Beginning with 1951, the Japanese imports consisted largely of tuna, canned in brine, rather than in oil in order to take advantage of a more favorable duty applying to the pack in brine.

4/ Includes 3,524,950 pounds from the Union of South Africa.

Source: Compiled from U. S. Bureau of the Census data.

The major sources of imports of canned shellfish are shown in table 12, page 23. Prior to World War II, large quantities of canned crab meat were imported from Japan. During the year 1953, imports of crab meat from Japan were only about half of the annual average of imports during 1934-38. Imports from the U. S. S. R. which exceeded prewar levels in 1950, were cut off abruptly in August 1950 as a result of a United States ban on such imports under authority contained in Section 307, Tariff Act of 1930 because of the convict, forced or indentured labor used in the production of canned crab meat by that Nation.

Imports of canned lobsters have shown large increases over 1934-38 average, increased imports coming from Canada, Cuba, and the Union of South Africa.

EXPORTS OF CANNED FISH AND SHELLFISH

United States exports of canned fish declined in 1952 and 1953 to almost half of the quantity exported in the prewar years (1934-38 average). Canned salmon exports totaled 2.2 million pounds in 1953 as compared with 43.9 million pounds of the 1934-38 annual average (table 13, page 25). The decline in exports since 1949 was due to the inability to sell abroad primarily because of restrictions on imports from the dollar area. Reduced salmon packs and increased unit prices for canned salmon was a factor affecting ability to export in 1953.

The United Kingdom which in prewar purchased the bulk of United States exports of canned salmon was almost entirely out of the market in 1952 and 1953. Canned sardine (including pilchards) exports in 1953 also reached low levels as a result of failure of the pilchard catch off California since 1951. Increased exports of canned anchovies, mackerel, and jack mackerel in 1953 resulted in the large gains shown in "Other" canned fish. Principal gains in exports of these items were made in the exports to the Philippines.

CHART 7.-UNITED STATES EXPORTS OF CANNED SALMON AND SARDINES
Million
pounds

Exports of canned shrimp in 1953 were far below those of the prewar years. The unit value of canned shrimp was about 6 times that of prewar. Increased exports of "other" shellfish shown in table 13, is accounted for largely by increased exports of canned squid. The value-per-pound for this group however is below that of the prewar (1934-38) average.

Canned sardines, largely California pilchards, have been the principal United States fishery export as far as quantities are concerned, from 1939 until 1953. The failure of pilchard runs resulted in a domestic pack of only 2,862,000 pounds for the year 1953, about 1 percent of the record production of 1950. Such a small pack precluded the usual volume of exports for sardines. To replace somewhat the decline of sardines for export, the domestic packers canned anchovies "sardine style" and the production of this item increased sharply in 1953 reaching 3,187,000 pounds. Most of the anchovies were packed for export.

The principal market for canned sardines since 1949 has been the Philippines (table 14). British Malaya, Egypt, Cuba and Belgium have provided other important outlets. The United Kingdom, an important market until 1949, has taken no United States sardines since that year.

Canned salmon exports are shown in table 15. The principal prewar export market for canned salmon was the United Kingdom. Between 1949 and 1953, practically no salmon was exported to the United Kingdom. The principal export market for canned salmon since 1949 has been the Philippines.

The 1953 domestic pack of canned salmon totaled 187,769,000 pounds, (see appendix table A) the smallest pack since 1921 when economic conditions restricted production. Total exports of canned salmon in 1953 totaled about 2,277,000 pounds. (Imports of canned salmon in 1953, however, totaled 12,165,000 pounds).

Table 16, shows United States exports of "Other Canned Fish, except Shellfish." These data include alewives, anchovies, antipasto, bonito, cod, haddock, hake, pollock, cusk, fish roe, menhaden, salmon roe, steelheads, whale meat, mackerel, and tuna. The pre-war average also included herring and kippered herring. The principal destinations of these products are the Philippines, Italy and Cuba.

The large increase in Philippine exports in 1953 was accounted for by greater exports of canned anchovies and mackerel.

Exports of canned shrimp since 1949 were less than half those of the prewar average. The principal export destination was Canada whose receipts of shrimp accounted for 77 percent of total canned shrimp exports. The United Kingdom which in prewar years was the principal destination for exports, has taken no canned shrimp in any appreciable quantity since 1949. (table 17).

Exports of canned crabs, and crab meat declined substantially since 1949 after increasing substantially from 1945 to 1947 (table 18, page 32). This decline in United States exports can probably be accounted for by the return to world markets of crab meat from Japan and Russia.

Canned oysters were exported in increased quantities in 1953 as compared with 1949. Principal destinations shown for exports were Canada, Costa Rica, Colombia, Venezuela and Saudi Arabia.

IMPORTS OF CURED FISH

Imports of cured fish in 1953 were about equal in quantity to those of the 1934-38 annual average. Little significant change was shown in the individual items (table 20). Cod and related species and herring were the principal species imported. Skinned or boned cod were imported in greater quantity as compared with the prewar average.

Increased imports of cured herring were received from Canada and Norway in 1953 while declines in receipts were noted from Iceland, United Kingdom, and the Netherlands (table 21). In the 1934-38 period, the Netherlands, and the United Kingdom were among principal suppliers of pickled and salted herring contributing about 41% of the total. Until 1953, the volume of that trade had not been resumed. Canadian imports supplied about 56% of total imports in 1951.

Exports of cured salmon have been less than one-tenth of the volume in the 1934-38 period (table 23). Germany, Sweden, Denmark, the Netherlands and Norway were principal export outlets prior to World War II. Of these countries, only the Netherlands have resumed trade at near prewar levels. In 1952 and 1953, Sweden has taken increasing quantities. Restrictions on the use of dollars for procurement of mild-cured salmon is the principal reason for the decline in this trade.

The 1953 exports of dried shrimp were also far below those of the 1934-38 average due to the loss of markets in the Far East. Cuba has been the principal market for this product in recent years.

OTHER EDIBLE FISH AND FISH PRODUCTS

In addition to the foregoing items, the United States exports a number of miscellaneous fish and shellfish products not separately classified such as canned caviar and other fish roe, canned fish cakes and paste, fresh and frozen mussels, oysters and scallops, and cooked but not canned lobsters and shrimp, which are grouped together and shown in table 24.

APPENDIX

UNITED STATES PACK OF CANNED FISH AND SHELLFISH

Canned fish and shellfish produced in the United States and Alaska during 1953 totaled 792,194,000, a pack totaling slightly below those of previous years back to 1949. The packs of canned sardines, mackerel, and salmon in 1953 were considerably below preceding years and the five-year average for 1934-38, (table A, page 43). A large increase in the pack of canned tuna, however, served to balance the deficits in canned sardines and salmon. Failure of the usual runs of fish was responsible for the low packs of sardines and salmon. The 1953 salmon pack was the smallest since 1921. The small pack of sardines was due to the almost complete absence of sardines off California. Record packs of tuna and anchovies were canned during the year. Most of the canned anchovies were packed for export.
