**ABSTRACT**—This study summarizes the results of a survey designed to provide economic information about the financial status of commercial reef fish boats with homeports in the Florida Keys. A survey questionnaire was administered in the summer and fall of 1994 by interviewers in face-to-face meetings with owners or operators of randomly selected boats. Fishermen were asked for background information about themselves and their boats, their capital investments in boats and equipment, and about their average catches, revenues, and costs per trip for their two most important kinds of fishing trips during 1993 for species in the reef fish fishery. Respondents were characterized with regard to their dependence on the reef fish fishery as a source of household income. Boats were described in terms of their physical and financial characteristics. Different kinds of fishing trips were identified by the species that generated the greatest revenue. Trips were grouped into the following categories: yellowtail snapper (*Ocyurus chrysurus*); mutton snapper (*Lutjanus analis*), black grouper (*Mycteroperca bonaci*), or red grouper (*Epinephelus morio*); gray snapper (*Lutjanus griseus*); deeper water groupers and tilefishes; greater amberjack (*Seriola dumerili*); spiny lobster (*Panulirus argus*); king mackerel (*Scomberomorus cavalla*); and dolphin (*Coryphaena hippurus*). Average catches, revenues, routine trip costs, and net operating revenues per boat per trip and per boat per year were estimated for each category of fishing trips. In addition to its descriptive value, data collected during this study will aid in future examinations of the economic effects of various regulations on commercial reef fish fishermen.

## Description of Economic Data Collected with a Random Sample of Commercial Reef Fish Boats in the Florida Keys

## Introduction

Bays, coral reefs, and offshore waters of the Florida Keys support commercial and recreational fisheries for reef fishes and other species. Many of the reef fishes, including snappers (*Lutjanidae*), groupers (*Serranidae*), porgies (*Sparidae*), grunts (*Haemulidae*), triggerfishes (*Balistidae*), wrasses (*Labridae*), tilefishes (*Malacanthidae*), and jacks (*Carangidae*), are vulnerable to overfishing because of their life history characteristics that include relatively sedentary behavior, slow growth, low natural mortality, large body size, delayed reproduction, and sex reversal for some species (SEFSC, 1992). As a result, the Florida Marine Fisheries Commission<sup>1</sup>, the South Atlantic Fishery Management Council<sup>2</sup>, and the Gulf of Mexico Fishery Management Council<sup>3</sup> have implemented regulations to conserve and rebuild depleted populations of reef fishes.

Scarcity of economic data has been a problem in the development of regulations for reef fishes. Data about total pounds landed and total ex-vessel value are available<sup>4</sup>, but there is little information about the financial performance of commercial reef fish boats or the economic effects of pro-

posed regulations. This report presents results from a recent survey that collected basic economic information about commercial fishing for reef fishes in the Florida Keys. Our objectives are to develop a stratified random survey of commercial reef fish boats with homeports in the Florida Keys; summarize characteristics of respondents and their boats; and estimate average catches, revenues, routine harvesting costs, and net operating revenues per trip and per year for commercial reef fish boats. The information presented here will be

made available to fishery managers to assist in their assessments of the consequences of proposed regulations for the commercial reef fish fishery.

This report is the third in a series of three about economic surveys of the commercial reef fish fisheries in the southeastern United States. Waters<sup>5</sup> reported on a similar survey of 196 commercial reef fish boats in the Gulf of Mexico. Waters, Rhodes, Waltz, and Wiggers<sup>6</sup> described a survey of 147 commercial snapper-grouper boats along the Atlantic coast from North Carolina to south Florida. In an unrelated survey, Suman and Shivlani<sup>7</sup> interviewed 337 fishermen in the Florida Keys to examine where they fished during 1995 in relation to the Florida Keys National Marine Sanctuary and to estimate species caught, relative effort in various fisheries, and trip costs per fishery.

## Materials and methods

Our survey consisted of three questionnaires (see Appendix 1). First, a screening questionnaire was used to record each attempt to telephone owners of randomly selected boats, verify their boat's eligibility for inclusion in the survey, and set up an appointment for a face-to-face interview with the owner or operator. Second, the basic questionnaire was used to obtain background information about respondents and their boats and to identify the primary species caught during the year. Third, supplemental questionnaires were used to obtain detailed information about average catches, revenues, and costs per trip for each boat's two most important kinds of trips for reef fishes in terms of their contributions to annual revenues. If a boat made only one kind of trip for reef fish, then a second supplemental questionnaire was administered regarding the most important kind of non-reef fishing trips, if any. We decided to collect supplemental information about only two kinds of fishing trips per boat as a way to limit the length of each interview, although it reduced the amount of resulting information about the profitability of fishing alternatives for boats that engaged in three or

more kinds of fishing trips. Interviews were performed under subcontract by Roper Starch Worldwide, Inc., a firm that specializes in research surveys for both the public and private sectors.

## Sampling design

The Florida Keys, by virtue of their unique location between the Atlantic Ocean and Gulf of Mexico, establish the boundary between the federal jurisdictions of the South Atlantic and Gulf of Mexico Fishery Management Councils. The South Atlantic Fishery Management Council has responsibility for management of fisheries in federal waters south and east of the Florida Keys, whereas the Gulf of Mexico Fishery Management Council has jurisdiction in federal waters west and north of the Keys. Depending on where they fish, fishermen may have to comply with regulations established by one or both regional fishery management councils, as well as the state of Florida which manages fisheries in state waters.

To fish commercially for reef fishes in federal waters, both regional fishery management councils require permits. The National Marine Fisheries Service (NMFS) issues reef fish permits for boats that fish commercially for reef fishes managed by the Gulf Council under its Fishery Management Plan for the Reef Fish Resources of the Gulf of Mexico.<sup>8</sup> NMFS issues snapper-grouper permits for boats that fish commercially for reef fishes managed by the South Atlantic Council under its Fishery Management Plan for the Snapper-Grouper Fishery of the south Atlantic Region.<sup>9</sup> The primary criterion to obtain a Gulf reef fish permit is that at least 50% of total earned income must come from commercial fishing, but not necessarily from reef fish fishing. The primary criterion to qualify for an Atlantic snapper-grouper permit is that at least 50% of total earned income or at least \$20,000 in gross revenues must come from commercial fishing, but not necessarily from reef fish fishing. Permits are issued annually.

We established the population of boats to be sampled from data files that recorded boats with permits for the Atlantic snapper-grouper and Gulf reef fish fisheries.<sup>10</sup>

<sup>10</sup> Data were obtained from the Fisheries Permits Team, National Marine Fisheries Service, Southeast Regional Office, 9721 Executive Center Drive North, St. Petersburg, FL 33702. The terms "boats" and "vessels" are used interchangeably in this report.

There were 811 boats with homeports in the Florida Keys that held either an Atlantic snapper-grouper permit, a Gulf reef fish permit, or both during 1993. The owners of most boats with federal permits apparently expected to fish on the Atlantic side of the Keys, or in both Atlantic and Gulf waters, but few expected to fish only in the Gulf of Mexico. Three hundred four boats held both an Atlantic snapper-grouper permit and a Gulf reef fish permit, 479 boats held a snapper-grouper permit and no reef fish permit, and only 28 boats held a reef fish permit and no snapper-grouper permit.

Given the project's limited budget, the survey was designed to reduce the chance of randomly selecting boats with minimal levels of participation in the fishery during the 1993 survey period.<sup>11</sup> We excluded boats whose owners let their permits expire during the first three months of 1993 or that obtained a new permit during the last three months of 1993. We further reduced the size of the sampling universe by focusing on gear types commonly used on boats in the snapper-grouper and reef fish fisheries. Applicants for federal permits were asked to:

"Select by letter up to four gears used by this vessel (1. Most important - 4. Least important)

- |                      |                     |
|----------------------|---------------------|
| 1. _____             | 3. _____            |
| 2. _____             | 4. _____            |
| a. Shrimp trawl      | g. Surface longline |
| b. Fish trap/pot     | h. Bottom longline  |
| c. Runaround gillnet | i. Lobster trap     |
| d. Reef fish bandit  | j. Diver            |
| e. Hand/troll line   | k. Other (specify)  |
| f. Rod & reel        | _____."             |

Boats with applications that reported the use of fish traps (choice b), vertical lines with bandit reels (d), rods and reels (f), bottom longlines (h), or diving gear (j) as among their top four gear choices were retained in the sampling universe.

The total population to be sampled consisted of 653 boats with homeports in the Florida Keys that, for at least three months during 1993, held an Atlantic snapper-grouper and/or a Gulf reef fish permit to fish commercially for reef fishes in federal waters and that also claimed on their permit applications the use of one or more common reef fish gears in their commercial fishing activities. Other boats in the Keys that fished commercially or recreationally for reef fishes or other

<sup>11</sup> We would have preferred to have had access to a list of boats that actively participated in the reef fish fishery, and if the survey were to be repeated, we would use logbook trip reports as the basis for the sampling universe. However, the logbook program on the Atlantic had recently begun at the time of this survey and the NMFS was still working to improve the industry's awareness of the reporting requirements.

**Table 1**

Final sample design and sampling outcome for the Florida Keys.

	Upper Keys	Middle Keys	Lower Keys	Total

species but did not meet these conditions were not included in the sampling universe.

Boats in the population to be sampled were stratified by homeport area as reported on their permit applications. Boats with homeports between Bahia Honda and Long Key were allocated to the Middle Keys region. Boats with homeports to the northeast of Long Key were allocated to the Upper Keys region, and boats with homeports southwest of Bahia Honda were allocated to the Lower Keys region. There were 112 boats (17% of the population of boats to be sampled) in the Upper Keys, 163 boats (25%) in the Middle Keys, and 378 boats (58%) in the Lower Keys.

The survey design called for a stratified random sample of 100 boats, with the planned number of interviews to be proportional to the total number of boats in each area. Hence, the sample design called for 17 interviews in the Upper Keys, 25 interviews in the Middle Keys, and 58 interviews in the Lower Keys (Table 1). Boats within each stratum were randomly ordered, and interviewers attempted to schedule meetings with boat owners or operators about their boat's fishing operations according to their position in the randomly ordered lists. Interviewers were instructed to make at least eight attempts to contact boat owners before selecting a replacement boat from the list. Owners of 32 boats could not be located and 2 others were deceased (Table 1).

Upon successfully contacting a boat owner, interviewers were instructed to determine if the owner actively

participated in the reef fish fishery in the Keys, with active participation defined as 5% or more of annual revenues having been earned from the sale of reef fishes. Seventy boats were contacted and ruled ineligible for inclusion in the survey: 54 did not land reef fishes during 1993 due to an owner's illness or the boat having been in disrepair, sold, or having fished for other species; and 16 did not earn at least 5% of their annual revenues from the sale of reef fishes (Table 1). Thirty-four additional boats were eligible for inclusion in the survey but refused to schedule an interview.

The final sample consisted of interviews about the operations of 102 boats: 21 in the Upper Keys, 24 in the Middle Keys, and 57 in the Lower Keys (Table 1). Primary cities of residence for respondents in the Upper Keys included Islamorada (9 respondents), Tavernier (7), and Key Largo (4); in the Middle Keys included Marathon (21) and Long Key (3); and in the Lower Keys included Key West (24), Big Pine Key (17), and Summerland Key (13).

## Statistical methods

This study describes economic characteristics of boats that actively participated in the reef fish fishery, as defined by the 5% eligibility criterion for inclusion in the survey. Responses from the screening questionnaire were used to estimate the number of boats that actively participated in the reef fish fishery as the ratio of boats eligible for the survey to the total number of boats contacted, with the ratio multiplied by the number of boats in the sampling universe. It was estimated that approximately 81% (30 of 37) of the boats in the Upper Keys, 57% (30 of 53) of the boats in the Middle Keys, and 66% (76 of 116) of the boats in the Lower Keys actively participated in the reef fish fishery (Table 1). The estimated number of eligible boats was 91 with a standard error of 6 in the Upper Keys, 92 with a standard error of 9 in the Middle Keys, and 248 with a standard error of 14 in the Lower Keys.

Responses from the basic questionnaire were summarized by area, with area defined as the Upper, Middle, and Lower Keys, and for all areas combined. Equations for stratum means and standard errors were obtained from sampling texts by Cochran (1977) and Thompson (1992). Equations for stratum totals and standard errors were adapted from Cochran's (1977) discussion of double sampling because the total number of active boats in the population had to be estimated.<sup>12</sup> Phase 1 in the double sampling context consisted of the tele-

phone screening portion of the survey which gathered information about each boat's eligibility for inclusion in the survey. The phase 2 subsample consisted of eligible (i.e., active) boats.

Responses from the supplemental questionnaire about each kind of fishing trip were grouped into selected subpopulations, such as trips on which boats caught primarily yellowtail snapper, regardless of stratum. Equations with which to estimate the average response by boats within each subpopulation were obtained from Cochran (1977) and modified to account for the extra variance associated with having to estimate the total number of active boats in each stratum.

It was assumed that non-respondents were not different from respondents, although this assumption was not tested due to a lack of prior information. Differences in the rates of non-response across strata are accounted for in the weighting scheme used to estimate overall population means and totals and their standard errors. However, the assumption remains that non-respondents were not different from respondents within each stratum.

The survey was structured and responses interpreted to minimize the potential for recall bias that could occur since fishermen were asked about their fishing activities and financial performance at the end of the year. Face-to-face interviews usually were scheduled at each fisherman's place of business so that financial records could be examined, especially for fixed costs and other infrequently incurred costs. In addition, respondents were asked about their average revenues and costs per trip rather than an exact accounting of revenues and costs for specific trips. Averages were easier to provide and are interpreted as expectations of revenues and costs based on the respondent's fishing experience throughout the year. Fishermen must make decisions about embarking on additional trips based on their anticipated revenues and costs although actual revenues and costs may differ at the conclusion of any specific trip.

## Results

### Characteristics of respondents

Respondents ranged in age from 22 to 82 years, with the overall average age being 52 years (Table 2). There were 17 respondents between 30 and 39 years of age, 19 respondents in the 40–49 year age group, 25 respondents in the 50–59 year age group, and 24 respondents in the 60–69 year age group. Six respondents were younger than 30, and eleven were 70 or older. On average, respondents in the Upper Keys were significantly younger than respondents in the Middle and Lower

<sup>12</sup> Richard S. Sigman of the U.S. Bureau of the Census, Economic Statistical Methods and Programming Division, pointed out the relevance of double sampling to this survey and derived the equation for the variance of stratum totals.

Keys. As a group, respondents were well-educated, with 82 of them having completed high school or having had additional education after high school (Table 3). Respondents reported having lived an average of 17 years in Monroe County (Table 2).

Household size ranged from 1 to 6 persons, including the respondent, with an overall average of 2.3 persons (Table 2). Someone other than the respondent was also employed in approximately 2 out of 5 households, although this ratio differed among areas (Table 4). More than 50% of the respondents in the Upper Keys reported that someone else in the household was employed, while less than 50% of the respondents in the Middle and Lower Keys reported other household members who were employed. Only 1 out of 6 households included a family member who was employed in commercial fishing with the respondent (Table 5).

Household incomes ranged from less than \$10,000 to more than \$150,000, with approximately two-thirds (52 of 78) of those who responded to the question citing household incomes of less than \$40,000 (Table 6). For all areas combined, respondents averaged approximately 37% of household income from commercial fishing for reef fishes, 18% from other types of commer-

cial fishing, and 45% from all other sources including incomes earned in non-fishing jobs held by the respondent and other household members, pensions, investments, and so forth (Table 2).

When compared to respondents in other areas, respondents in the Upper Keys reported the greatest reliance on commercial fishing for reef fishes as a source of household income and the least reliance on sources other than commercial fishing (Table 2). On average, commercial fishing for reef fishes accounted for 52% of household income in the Upper Keys. Four respondents (19%) reported that 100% of their household income came from commercial fishing for reef fishes, whereas 11 respondents (52%) reported no household income from other types of commercial fishing, and 7 respondents (33%) reported no non-fishing sources of household income.

In contrast, respondents in the Middle Keys reported the least reliance on commercial fishing for reef fishes (Table 2). One-half of the respondents reported

spondents reported less than 20% of their household income came from commercial fishing for reef fishes, and 54% reported no income from commercial fishing for other species.

Nearly all respondents (96 of 102) were owners and operators of the boats selected for the survey (Table 7). Five of the remaining respondents were owners who did not captain their boats and the sixth was a hired captain. Respondents reported between 2 and 66 years experience as commercial fishermen, with an overall average of 16.5 years (Table 2). The average number of years experience was about the same in all three areas of the Keys.

Respondents usually reported experience with several kinds of fishing gear (Table 2). All but five respondents reported experience with rods and reels (Table 8). In addition, respondents in all areas frequently cited experience with bandit reels, trolling lines, handlines, and spiny lobster and/or stone crab traps. Respondents in the Upper and Lower Keys cited experience with spear fishing, usually without powerheads. Twenty-two respondents reported having ever used just one gear, usually rods and reels.

Approximately 25% of the respondents reported some form of employment in addition to their commercial fishing activities (Table 9). The proportion of respondents who reported other employment was greatest in the Upper Keys (8 of 21=38%), least in the Middle Keys (4 of 24=17%), and about average in the Lower Keys (13 of 57=23%). Approximately 24% of respondents with other employment (6 out of 25) cited some type of commercial chartering activity, including fishing charters and guide services (Table 10). Other employment exhibited a seasonal component in the Lower Keys where employment was highest between April and September, but was not seasonal in the Upper or Middle Keys (Table 11).

## Characteristics of sampled boats

Sampled boats were primarily of fiberglass construction (Table 12) and ranged in length from 18 to 65 feet, with an overall average of 28.9 feet (Table 13). The 20–24 ft length class with 21 boats, the 25–29 ft length class with 38 boats, and the 30–34 ft length class with 28 boats were the most frequently occurring. Only 3 out of 102 sampled boats were smaller than 20 feet and 2 were longer than 45 feet. Boats did not differ significantly in average length by area within the Keys. The average age of boat was 14 years (Table 13).

The boats' engines ranged from 80 to 670 horsepower (hp), with an overall average of 247 hp (Table 13). Most sampled boats (83 out of 101) were reported to have engines with 100 to 399 hp. Fuel capacity ranged from 12 to 1600 gallons, with two-thirds of the boats having a capacity of less than 250 gallons and all but seven boats having a capacity of less than 500 gallons. Fifty percent of sampled boats in all areas combined had a fuel capacity of less than 135 gallons (Table 13). A majority of boats in the Upper and Middle Keys used diesel-powered engines, whereas a majority of boats in the Lower Keys used gasoline-powered engines (Table 14).

Boats were equipped with holding boxes or insulated coolers for ice and fish. These ranged in capacity from 80 to 10,000 pounds, with an overall average of 1,355 pounds (Table 13). The average capacity of fish boxes did not differ significantly by area for boats in the Keys. Fifty percent of the sampled boats in all areas combined had a holding capacity of less than 600 pounds.

One-third of the sampled boats were documented with the U.S. Coast Guard. Nearly all were equipped with LORAN-C, VHF radios, and some form of depth recorder or fish finder (Table 15). Twenty-three of 102 sampled boats had GPS in 1993, and it is expected that many of the remaining boats have purchased GPS units since then.

Most (88) sampled boats were purchased by their current owners since 1980 for an original investment ranging between \$2,000 and \$400,000, with an overall average investment of \$41,647 per boat and a median investment of \$33,000 per boat (Table 16). The average investment for boats in the Upper Keys was numerically greater than the average investments for boats in the Middle and Lower Keys, but was not statistically different after accounting for variation of the responses. The estimated total investment for all 431 active boats in the sampled population was \$17.9 million: \$6.0 million for boats in the Upper Keys, \$3.6 million for boats in the Middle Keys, and \$8.3 million for boats in the Lower Keys (Table 16).

Respondents estimated that the value of their boats at the time of the survey ranged from \$1,500 to \$115,000. Boats in the Upper Keys averaged \$32,733; boats in the

Middle Keys averaged \$18,587; and boats in the Lower Keys averaged \$21,807 (Table 16). Average resale values were not statistically different among areas after accounting for variation of the responses. The overall average resale value was \$23,421 per boat, with a median value of \$18,000 per boat.

The estimated total resale value for all boats in the sampled population was \$10.1 million (Table 16). This is loosely interpreted as the estimated total value of capital currently invested in the commercial reef fish fishery in the Florida Keys, although some boats in the sampled population participated in other fisheries,

and other boats with minimal participation in the reef fish fishery were excluded from the sampling universe. Boats were worth an estimated \$3.0 million in the Upper Keys, \$1.7 million in the Middle Keys, and \$5.4 million in the Lower Keys (Table 16).

Resale value depends, in part, on the expected profitability of fishing. One measure of expected future profitability is profit during the current year. Average annual gross revenues and net incomes were highest for boats in the Upper Keys, lowest for boats in the Middle Keys, and about average for boats in the Lower Keys (Table 16). Revenues averaged \$49,581 per boat per

lion in revenues and \$0.3 million in net income in the Middle Keys.

### Fishing activities

Nearly all boats fished for reef fishes in the Keys (Table 17), which accounted for an overall average of 60% of each boat's annual revenues (Table 18). One-half of the boats reported that reef fishes in the Keys accounted for more than 70% of their annual revenues. More than two-thirds of them also fished for other species in the Keys (Table 17), which accounted for an overall average of 20% of annual revenues (Table 18). One-half of the sampled boats reported that other species in the Keys accounted for less than 10% of annual revenues.

Approximately one-third of the boats in the Middle and Lower Keys also fished for reef fishes and other species in Gulf waters outside of the Keys (Table 17), with a combined average contribution for reef fishes and other species of 14–15% of annual revenues per boat (Table 18). Few boats fished in Atlantic waters outside of the Keys (Table 17), with a correspondingly small average contribution to annual revenues (Table 18). Only seven boats in the sample, including two from the Upper Keys, one from the Middle Keys, and four from the Lower Keys, reported revenues from charter fishing (Table 17). Nevertheless, these few boats earned relatively high fractions of their annual revenues from chartering, which resulted in unexpectedly high overall average contributions to annual revenues, especially in the Upper Keys (Table 18).

Given a list of 31 important reef and non-reef species, respondents ranked the species caught during 1993 in terms of their importance to annual revenues. To derive estimates of the total number of boats that fished for each species, survey responses were expanded to the entire population of eligible (active) boats within each stratum and then added over all strata. The estimated total numbers of boats are not additive across species because boats that harvested more than one species would be counted more than once.

Yellowtail snapper (*Ocyurus chrysurus*) clearly was the most important species in all three areas of the Keys. Eighteen of 21 respondents (86%) in the Upper Keys fished for yellowtail snapper, with 14 of them citing it as their most important species in terms of annual revenues. In the Middle Keys, 20 of 24 respondents (83%)

Total number of boats	91	92	248	431

fished for yellowtail snapper, with 16 of them citing it as their most important species. Similarly, 47 of 57 respondents (82%) in the Lower Keys fished for yellowtail snapper, with 38 of them citing it as their most important species. Overall, it was estimated that 359 out of 431 active boats (83%) in the sampled population fished for yellowtail snapper, and that 287 of them (67%) ranked yellowtail snapper as their most important species in terms of annual revenues (Table 19).

Yellowtail snapper was an important source of revenue throughout the year. Fifty percent or more of the sampled boats fished for yellowtail snapper each month between December and June in the Upper Keys, between December and April in the Middle Keys, and between October and June in the Lower Keys. Yellowtail snapper was the most frequently landed species even in the remaining months. The estimated total number of active boats that landed yellowtail snapper as an important source of revenue ranged from 141 in August to 278 in March (Table 20). Other boats harvested yellowtail snapper incidentally while fishing primarily for other species (Table 21).

Boats fished for other species too, but none were cited as frequently or ranked as highly as yellowtail snap-

**Table 18**

Estimated means, medians, and standard errors of means for the percentages, by source, of annual revenues per boat. (Note: This table shows percentages of annual boat revenues from each type of fishing enterprise, and should not be confused with information presented in Table 2 which shows percentages of household income from different sources.)

per as an important source of annual revenues. Spiny lobster (*Panulirus argus*) was the species cited second most frequently as being most important in terms of annual revenues (Table 19). Lobsters were landed between August and March with the estimated number of boats declining each month (Table 20). It was estimated that about 20% of the active population of boats fished for spiny lobster during the early months of the lobster season.

Black grouper (*Mycteroperca bonaci*), mutton snapper (*Lutjanus analis*), gray snapper (*L. griseus*), and king mackerel (*Scomberomorus cavalla*) were commonly mentioned as the second, third, fourth, or lower ranked species (Table 19), principally in the Upper and Lower Keys. Black grouper were harvested year-round both as an important source of revenue (Table 20) and as an incidentally caught species (Table 21), with the greatest levels of directed effort occurring between November

and April. Gray snapper also were harvested throughout the year (Tables 20 and 21), with the greatest directed effort occurring between May and August in the Lower Keys, between June and August in the Upper Keys, and between February and July in the Middle Keys. Mutton snapper were harvested year-round, but primarily between October and July and primarily as an incidentally caught species (Tables 20 and 21). King mackerel were caught seasonally during the late fall and spring, with the greatest number of boats fishing during December and January (Tables 20 and 21).

Less frequently ranked species included stone crab (*Menippe mercenaria*), red grouper (*Epinephelus morio*), and greater amberjack (*Seriola dumerili*), among others (Table 19). Stone crab were harvested primarily between October and March (Table 20). Red grouper was ranked no higher than the third leading producer of revenues (Table 19), primarily in the Lower Keys, whereas other

boats caught them incidentally while fishing for other species (Table 21). Greater amberjack were landed during the spring as an important source of revenue (Table 20), primarily in the Upper Keys. Dolphin (*Coryphaena hippurus*) was the most frequently harvested species within the “other non-reef fish” category.

### Financial performance on different kinds of fishing trips

Some boats fished in one kind of activity year-round whereas others rotated among several kinds of fishing trips according to seasonal availability of fish, seasonal variation in prices, fishery regulations, and so forth. One objective of this survey was to estimate average net operating revenues per boat per trip and per boat per year earned on the most important kinds of fishing trips taken by reef fish boats. For this purpose, respondents completed supplemental questionnaires about fishing effort, catches, revenues, and routine operating costs

for their two most important kinds of fishing trips for reef fish. Boats that engaged in only one kind of fishing for reef fish were asked about it and also about trips for their highest ranked non-reef fish species, if any. Seventy-seven respondents completed supplemental questionnaires about two kinds of fishing trips and 25 others completed questionnaires about one kind of trip, for a total of 179 supplemental questionnaires.

Each kind of fishing trip was defined by noting the species with the largest contribution to the total revenues of the trip. A majority of respondents cited yellowtail snapper as one of their most important sources of revenues, and other kinds of trips were described less frequently (Table 22). Small sample sizes necessitated that several kinds of trips be combined to estimate average catches, revenues, routine trip costs, and net operating revenues per boat per trip and per boat per year. Trips for yellowtail snapper, gray snapper, and greater amberjack were examined separately, while trips for mutton snapper, black, red, and unspecified groupers

**Table 21**

were combined because these species frequently were landed together. Also, trips for deeper water species such as snowy grouper (*E. niveatus*), yellowedge grouper (*E. flavolimbatus*), warsaw (*E. nigrilus*), blueline tile-

fish (*Caulolatilus microps*), golden tilefish (*Lopholatilus chamaeleonticeps*), and silk snapper (*Lutjanus vivanus*) were combined. Relatively few observations were obtained for non-reef fish species because respondents

**Table 23**

Average net operating revenues per trip, per day fished, and per person per day fished for different kinds of fishing trips by commercial reef fish boats in the Florida Keys.

Variable	Kind of trip				
	Yellowtail snapper	Black grouper/ mutton snapper	Gray snapper	Deepwater species	Greater amberjack
Net operating revenues per trip	\$337	\$323	\$195	\$162	\$563
Days fished per trip	1.6	1.4	1.3	1.0	1.0
Net operating revenues per day fished	\$190	\$225	\$149	\$173	\$563
Persons aboard per trip	1.8	1.7	2.3	1.6	2.5
Net operating revenues per person per day	\$110	\$134	\$ 76	\$107	\$206
Trips per boat per year	52	33	25	32	25
Net operating revenues per boat per year	\$9,901	\$9,062	\$4,469	\$5,049	\$14,912
Estimated number of boats per year <sup>1</sup>	350	112	83	46	33
Net operating revenues per year	\$3,468,216	\$1,012,542	\$372,448	\$232,251	\$498,145

  

Variable	Spiny lobster	King mackerel	Dolphin
	Net operating revenues per trip	\$1,838	\$106
Days fished per trip	2.6	1.0	1.0
Net operating revenues per day fished	\$627	\$106	\$88
Persons aboard per trip	2.3	1.7	2.0
Net operating revenues per person per day	\$363	\$68	\$45
Trips per boat per year	40	18	18
Net operating revenues per boat per year	\$47,552	\$2,238	\$2,236

<sup>1</sup> The estimated number of boats per year differs in definition, and hence in magnitude, from that presented in Table 19. This table presents estimates of the total number of boats that participated in particular kinds of trips as defined by the species with the greatest contribution to total revenues of the trip. Table 19 presents estimates of the number of boats for which each species was an important source of annual revenue regardless of the kind of trip on which it was caught.

were asked to complete supplemental questionnaires about the two most important types of trips for reef fishes even if non-reef fish alternatives made larger contributions to the annual revenues of the boat. Trips for spiny lobster, king mackerel, and dolphin were seasonal alternatives to fishing for reef fishes.

The economic performance of each kind of fishing activity was evaluated from the perspective of boat owner, captain, and crew combined, rather than from the perspective of the boat owner only, because the share system of payments in commercial fisheries distributes the economic surplus from the fishing operation among boat owner, captain, and crew. Although share payments to captain and crew may represent labor costs to the boat owner, they may exceed actual, but unknown, opportunity costs of labor, which is the appropriate definition of cost from the perspective of society as a whole. Opportunity cost could be assumed equal to the average wage paid in the major local industry, but this wage varies geographically and it may be difficult to accurately determine the circumstances relevant to each sampled boat. Therefore, economic per-

formance is evaluated in terms of total share payments to owner, captain, and crew without imposing assumptions about opportunity cost that may or may not be relevant. Estimates of share payments for owner, captain, and crew separately are tabulated for readers who desire more detailed information.

Three measures of overall economic performance were calculated for each kind of fishing trip: net operating revenues per trip, per day fished, and per person per day fished (Table 23). Net operating revenues per trip were defined as the combined share payments to boat owner, captain, and crew after deducting routine trip expenses, which included fuel, bait, ice, lost gear, food, packing charges if any, and other miscellaneous supplies. Net operating revenues per day fished were calculated as net revenue per trip divided by days fished per trip to correct for observed variations in net revenue due to differences in the duration of fishing trips among boats and between fishing activities. Net revenues per person per day fished were calculated as net revenue per day fished divided by the number of persons aboard to correct for observed variations in net

**Table 24**

Estimated means and standard errors per boat per trip in the Florida Keys when yellowtail snapper made the greatest contribution to trip revenue.

Variable	Sample size	Maximum per boat per trip	Average per boat per trip	Std. error per boat per trip	Lower 95% conf. limit	Upper 95% conf. limit
Pounds of yellowtail snapper	82	1,500	182	33	116	249
Total pounds, all species	82	2,064	246	45	156	336
Percent pounds by yellowtail snapper	82	100	77	2	73	80

Net revenue per day fished per trip	83	2,441	190	33	123	256
Net revenue per person per day	83	1,221	110	17	76	145

revenue due to differences in crew size.<sup>13</sup> Net revenue per person per day fished reflects the overall fishing operation's economic performance rather than an accounting of actual wages earned by individual crew members.

Share payments should not be interpreted as profit, especially when examining averages per boat per year and the estimated totals for all boats that participated in each kind of fishing. Each kind of fishing represented one of several kinds of fishing trips on which boats and fishermen may have participated during the year. Hence, estimates of net operating revenues for each kind of fishing exclude the contributions of other fishing activities to the boat's overall net income. Also, boat owners incurred overhead expenses, other fixed costs, and other variable costs that were not routinely encountered per trip and which were not accounted for in these calculations. Likewise, overhead expenses incurred by crew members as independent contractors to boat owners were not accounted for in these calculations. Estimates of net income (before taxes) per boat per year for all fishing activities combined and for the fishery as a whole were presented in Table 16.

<sup>13</sup> Net revenues per day fished and per person per day fished were calculated for each boat, and the resulting individual observations were used to estimate averages and standard errors per boat for each kind of fishing.

A secondary objective was to estimate total catches, revenues, trip costs, and net operating revenues for all boats engaged in each kind of fishing trip. Estimates of fishery-wide totals in Table 23 were determined as the average per boat per year multiplied by the estimated total number of active boats that participated in each kind of fishing. However, the number of boats that participated in the less important reef fishing activities and the non-reef fish alternatives likely would be underestimated in the sample compared to the actual fishery because of the need to limit each interview to a maximum of two supplemental questionnaires if the respondent participated in more than two kinds of trips. Hence, the possibility for errors in estimating fishery-wide totals is greater than when estimating averages per boat per trip or per boat per year. In fact, estimates of fishery-wide totals were not made for the non-reef fish alternatives because respondents specifically were not asked about them if they had at least two kinds of trips for reef fishes.

Yellowtail snapper (Tables 24–26) was the most commonly sought species by commercial reef fish boats in the Florida Keys. In all, 350 boats were estimated to have made trips with yellowtail snapper as their primary species (Table 26). Collectively, they were estimated to have made 18,215 trips, fished for 20,445 days, and caught over 2.4 million pounds of fish worth about \$5.2 million. Yellowtail snapper trips returned an estimated

Number of trips	83	52	350	18,215	2,053	14,114	22,315
Days fished	83	58	350	20,445	2,103	16,245	24,645

\$3.5 million to boat owners, captains, and crew members after payment of routine trip costs.

The popularity of yellowtail snapper trips was attributable to the species' ubiquitousness rather than its profitability. Trips were taken year-round and in all three areas of the Keys. Boats averaged 246 pounds worth \$510 per trip, of which yellowtail snapper represented about 77% of catch and 81% of revenues (Table 24). Boats paid an average of \$173 in routine trip costs and earned an average of \$337 per trip to be shared by boat owner, captain, and crew. After accounting for variation among boats in days fished per trip and numbers of persons aboard, yellowtail

snapper trips returned an average of \$110 per person per day fished (Table 24) and \$9,901 per boat per year (Table 25). Net operating revenues per trip for yellowtail snapper averaged more than on trips for gray snapper, deep water reef fishes, king mackerel, or dolphin; they were about the same as on trips for black grouper and mutton snapper, but were less than on trips for spiny lobster or greater amberjack (Table 23). Yellowtail snapper trips yielded smaller net returns than trips for black grouper and mutton snapper when evaluated per day fished and per person per day because yellowtail snapper trips were slightly longer and carried slightly more people aboard.

**Table 27**

Number of boats that fished each month for alternative target species and that otherwise fished for yellowtail snapper.

Boats that targeted yellowtail snapper also fished for other species. Alternatives included black grouper or mutton snapper year-round with peak activity between January and March, gray snapper in the summer, especially in June and July, spiny lobster between August and March, stone crab between October and May, and king mackerel in the winter, especially in December and January (Table 27).

Spiny lobster (Tables 28–29) was cited second most frequently as being the most important species in terms of annual revenues (Table 19), and averaged higher net returns than any other kind of fishing trip examined in this study (Table 23). After deducting routine trip costs, boat owners, captains, and crew members shared \$1,838 per trip, which was five times greater than net operating revenues on yellowtail snapper trips. Although lobster trips were nearly twice as long, on average, as yellowtail snapper trips and carried a relatively large number of persons aboard, average net returns for lobster trips evaluated per day fished and per person per day were more than three times higher than for yellowtail snapper trips. High net returns on spiny lobster trips were due to both a high average catch per trip and high

ex-vessel price. Boats averaged 659 pounds of lobsters worth \$2,383 per trip (Table 28).

Lobsters were targeted between August and March, with the estimated number of boats declining as the season progressed. Boats averaged 40 spiny lobster trips per year and earned \$47,552 per year to be shared by boat owners, captains, and crew members (Table 29).

Greater amberjack fishing (Tables 30–32) was the highest volume activity examined in this study. On average, boats landed 1,212 pounds on trips that averaged only one day's duration (Table 30). The high volume of landings enabled greater amberjack to produce higher net returns than other reef fishes despite the relatively low ex-vessel price per pound. Boat owners, captains, and crew members shared \$206 per person per day fished (Table 30) and \$14,912 per boat per year (Table 31) after deducting routine trip costs; these were the highest returns among the activities for reef fishes examined in this study (Table 23). It was estimated that boats in the sampled population landed nearly 0.9 million pounds of greater amberjack on trips for which it contributed the greatest portion of total revenues per trip (Table 32). Boats fished for greater am-

berjack during the spring, with the greatest number of them fishing in May (Table 20). Participation in the fishery was limited by regulations that prohibited commercial sales of greater amberjack in April during the spawning period.<sup>9</sup>

Trips for black grouper and/or mutton snapper (Tables 33–35) were related in several respects to trips for yellowtail snapper. Black grouper and mutton snapper were the two species most frequently cited as incidental catches on yellowtail snapper trips, and yellowtail snap-

per was one of the most common incidentally caught species on black grouper or mutton snapper trips.

Catches, revenues, and net returns were comparable. Boats landed an average of 209 pounds of fish per trip worth \$438, with approximately 73% of the pounds and

77% of the revenues from black grouper, red grouper, or mutton snapper (Table 33). Although the average net return of \$323 per trip was about the same as on yellowtail snapper trips, black grouper or mutton snapper trips were slightly shorter and carried slightly fewer

Net revenue per person per day	26	979	134	37	55	213

persons aboard. Hence, the average net return per person per day fished was higher (Table 23). Boats took an average of 33 trips per year for black grouper and/or mutton snapper, which produced an average of \$9,062 per year to be shared by owner, captain, and crew (Table 34). It is estimated that, in aggregate, they landed approximately 0.7 million pounds of fish worth \$1.4 million (Table 35).

Although gray (mangrove) snapper (Tables 36–38) is one of the most common species in the Keys, net operating revenues were lower than for the other reef fishes examined in this report because catch rates and dock-side prices were relatively low. Respondents landed an average of 163 pounds of fish worth \$301 per trip (Table 36). After accounting for variation in crew size and trip duration, boat owners, captains, and crew members

shared an average of only \$76 per person per day fished (Table 36) and \$4,469 per boat per year (Table 37) after deducting routine trip costs. It was estimated that boats on gray snapper trips landed 0.3 million pounds of fish worth nearly \$0.6 million (Table 38). Gray snapper were targeted throughout the year, but primarily between May and August (Table 20).

Other, less frequently targeted species included the deep water groupers and tilefishes (Tables 39–41), of which snowy grouper and blueline tilefish were the

most common. Average net operating revenues on deep water reef fish trips were lower than on yellowtail snapper trips (Table 23). Boat owners, captains, and crew members shared an average of \$107 per person per day fished after deducting routine trip costs. The estimated 46 boats that targeted deep water groupers and tilefishes landed an estimated 0.25 million pounds worth approximately \$0.37 million (Table 41), and returned \$5,049 per boat per year to be shared by owners, captains, and crew members (Table 40). Fishing for deep

water species occurred throughout the year with a seasonal peak in April, May, and June, and a seasonal low in August and September (Table 20).

King mackerel trips (Tables 42–43) produced lower net operating revenues, on average, than did trips for any of

the reef fishes examined in this study (Table 23). Boat owners, captains, and crew members shared \$68 per person per day fished and \$2,238 per boat per year after deducting routine trip costs. King mackerel fishing was seasonal, and occurred primarily in December and January (Table 20).

**Table 38**

Number of persons aboard	11	2	1.6	0.2	1.3	2.0
Pounds (all species) per day fished	10	545	172	45	61	282
Net revenue per day fished per trip	10	452	173	45	68	278
Net revenue per person per day	10	226	107	28	42	171

Average net operating revenues on dolphin trips (Tables 44–45) were the lowest from among the alternatives examined in this study (Table 23). Boat owners, captains, and crew members shared only \$45 per person per day fished and \$2,236 per boat per year after deducting routine trip costs. Trips on which dolphin was the most important species were made between April and September, with peak fishing activity occurring in May and June.

## Discussion

This report describes the financial performance of commercial reef fish boats when participating in different kinds of fishing trips in the Florida Keys. The survey confirmed that commercial fishermen in the Keys usually were generalists rather than specialists. While some boats engaged in only one kind of fishing, most alternated among two or more different kinds of fishing

**Table 40**

Estimated means and standard errors per boat per year in the Florida Keys when deep water groupers and tilefish made the greatest contribution to trip revenue.

Variable	Sample size	Maximum per boat per year	Average per boat per year	Std. error per boat per year	Lower 95% conf. limit	Upper 95% conf. limit

Payment to crew	11	1,463	46	67,296	35,046	-21,363	155,956
Number of trips	11	32	46	1,466	522	276	2,657
Days fished	10	33	42	1,416	523	208	2,624

trips. Although we did not inquire about motivations for switching behavior, switching probably occurred for a variety of reasons including disparities in net returns per unit of fishing effort, seasonal availability of fish, regulated openings and closings, experience with alternative kinds of fishing, and so forth.

In the short-term, fishermen maximize profits or minimize losses by taking additional trips for a particular species if expected trip revenues exceed expected variable costs per trip. In theory, fishermen will switch among fishing activities if they expect to earn more in

the new fishery than they could in their existing fishery after accounting for switching costs. Over time, disparities among fishing activities in potential net returns per unit of effort tend to disappear because each entrant into the new fishery disperses a portion of the available catch among a greater number of participants, and hence reduces net return per unit of effort. Similarly, each defection from the existing fishery reallocates slightly larger catches to the remaining participants, thereby increasing their net return per unit of effort.

**Table 42**

Estimated means and standard errors per boat per trip in the Florida Keys when king mackerel made the greatest contribution to trip revenue.

Variable	Sample size	Maximum per boat per trip	Average per boat per trip	Std. error per boat per trip	Lower 95% conf. limit	Upper 95% conf. limit

Payment to crew	8	2,176	338	259	-346	1,021
Number of trips	8	32	18	3	10	26
Days fished	8	32	18	3	10	26

In practice, net returns probably never will be truly equalized due to a variety of impediments to switching. For example, imperfect information about opportunities in alternative kinds of fishing, the need for capital investment in specialized gear, or the lack of experi-

ence with alternative fishing techniques may preclude some fishermen from switching. And geographic, seasonal, or regulatory restrictions may limit switching behavior that would tend to equalize net returns per unit of effort.

**Table 44**

Estimated means and standard errors per boat per trip in the Florida Keys when dolphin made the greatest contribution to trip revenue.

Days fished	6	45	18	6	0	35

Regulation of one kind of fishing activity often precipitates a transfer of fishing effort to other species, some of which may be overfished or nearly overfished. These data can be used to model the supply of fishing effort to help predict the effects of regulation, includ-

ing possible switching behavior among different kinds of fishing.

The different kinds of fishing examined in this study included trips for yellowtail snapper, black grouper or mutton snapper, greater amberjack, gray snapper, deep

water groupers and tilefishes, spiny lobster, king mackerel, and dolphin. Several of the reef fish species such as yellowtail snapper and black grouper are available year-round, while others such as greater amberjack, mutton snapper, and gray snapper are available in seasons that probably correspond with aggregations of spawning fish. Spiny lobster and king mackerel are available during regulated seasons. Each kind of fishing was evaluated by comparing average net operating revenues per trip as a measure of the combined share payments to boat owner, captain, and crew after deducting routine trip expenses.

Spiny lobster produced the highest average share payments per trip from among the kinds of fishing examined in this study, due to high catch rates and high dockside prices. About 20% of the sampled boats participated in the spiny lobster fishery despite the need for trap certificates, which are marketable fishing privileges issued by the state of Florida, and lobster traps and trap pullers as specialized gear. Fishing effort in the spiny lobster fishery was greatest in August at the beginning of the season and tended to shift to stone crab when its season opened or to reef fishes and other species as lobster densities and catch rates declined.

We were surprised to find that greater amberjack trips yielded higher average share payments per trip than other kinds of fishing for reef fishes. Net operating revenues were high, on average, because low ex-vessel prices were more than offset by large catches per trip. Despite high net returns per trip, the estimated participation levels such as numbers of boats and trips were relatively low, probably due to the seasonal nature of greater amberjack abundance and regulatory restrictions during the peak months of abundance.

The yellowtail snapper resource supported the principal kind of fishing among reef fish boats in the Keys. More than 80% of the sampled boats fished for yellowtail snapper at some time during the year, with most of them ranking it as their most important source of revenue on an annual basis. The high rate of participation in the yellowtail snapper fishery probably reduced average share payments by splitting the overall catch among the competing trips.

Trips for black grouper or mutton snapper were the next most frequently cited kind of fishing in our sample. Given the year-round availability of black grouper and mutton snapper as primary or secondary species, we expected some boats to switch between black grouper/mutton snapper trips and yellowtail snapper trips with the result that average net returns per unit of effort would tend to equality. In fact, the estimated average net operating revenues per trip were approximately equal even though average net operating revenues per day fished and per person per day fished were higher for black grouper than for yellowtail snapper.

In addition to their descriptive value, these data can be used in future analyses of regulation in the reef fish fishery. The economic effects of regulation on commercial fishermen are measured as changes in producers' surplus, loosely defined as payments earned by capital and labor in excess of their opportunity costs. Ideally, changes in producers' surplus would be calculated as the lesser of the change in producers' surplus in the regulated fishery, or the reduction in producers' surplus between the regulated fishery and the next-best alternative kind of fishing. For example, the economic effects of seasonal closures would be the loss of producers' surplus in the closed fishery if no alternative kind of fishing existed during the closed season, or the reduction in producers' surplus between the closed and alternative fisheries if an alternative existed.

Financial performance was reported in terms of net operating revenues to boat owner, captain, and crew (i.e., total share payments), which differs from producers' surplus. Opportunity costs should be deducted from net operating revenues to obtain a measure of producers' surplus. Opportunity costs are determined by the next-best earnings opportunities, such as the major local industry, available to fishermen. These opportunities vary geographically, and their determination is an important topic for future research.

In conclusion, this study provides a snapshot of the financial performance of commercial reef fish boats on different kinds of fishing trips in the Florida Keys. The research can assist fishery managers in evaluating the consequences of regulation in the commercial reef fish fishery. While it cannot be claimed that these data and analyses will alter regulation in the reef fish fishery, it is our belief that this information will enable fishery managers to make better-informed decisions among regulatory alternatives.

## Acknowledgements

This study would not exist except for the substantial efforts by hundreds of individuals, including data collectors and respondents. Field supervisors, interviewers, editors, and data-entry personnel performed an outstanding job in a difficult task. Staats Abrams and Gerry Kremenko, from Crossley Surveys, a division of Roper Starch Worldwide, Inc., supervised the collection of data and the data entry process. The data collection phase of this study was funded by the National Marine Fisheries Service through contract 50WCNF306028 with Roper Starch Worldwide, Inc., and MARFIN award NA47FS0014 with the South Carolina Department of Natural Resources.

We are especially thankful to the fishermen who as a group spent hundreds of hours being interviewed. One hundred two fishermen were interviewed over a wide

geographic region, and many were contacted again by telephone to check responses that may have seemed unusual or inconsistent with answers to other questions. Their patience and willingness to provide information about themselves and their fishing activities have led to a better understanding of the financial aspects of commercial fishing for reef fishes.

Also, we thank two anonymous reviewers for their helpful comments and suggestions.

Hello. I am \_\_\_\_\_ of Crossley Surveys, an independent survey research firm. We are conducting a survey on behalf of the Division of Marine Resources, South Carolina Department of Natural Resources and the National Oceanic and Atmospheric Administration, National Marine Fisheries Service.

This survey is being conducted to provide federal regulators with information concerning the financial situation of commercial fishermen who fish for reef fish such as snapper, grouper, amberjack, porgy, sea bass, tilefish, hogfish and triggerfish. As you know, decisions are being made for managing reef fisheries in Federal waters of the U.S. South Atlantic and Gulf of Mexico. Your input will help to identify potential economic effects of fishery management regulations that might be proposed by the Federal government.

Your boat, having Vessel Registration Number (READ NUMBER), was randomly selected from a list of federal permit holders who fish commercially for snapper, grouper and other reef fish. Your responses will be kept strictly confidential and will be combined with the responses of other commercial fishermen. When the data are presented, they will be in the form of group totals and averages so there will be no way of tracing responses back to you or that boat.

The survey is voluntary, but we urge you to participate. We need your answers. Fishermen like yourself, who have a vital stake in the management decisions being made, can provide the information necessary to evaluate the economic effects of different management options on commercial reef fishermen.

The interview can take about 90 minutes. The purpose of this call is to set up an appointment with you at your convenience to meet with you in person to conduct this interview. It may be helpful to you to have your records available in case you need to refer back to them for catch, revenue and cost data relating to the boat we selected.

1a. First, did you fish commercially for reef fish such as snapper, grouper, amberjack, porgy, sea bass, tilefish hogfish or triggerfish during 1993? Yes 1 (1c) 108  
No 2 (1b)

b. Why didn't you fish commercially for reef fish during 1993?

109-116

---

---

---

---

c. Have you been fishing for reef fish this year - 1994? Yes 1 (INSTRUCTION BEFORE Q.2) 118  
No 2 (1d)

**SOUTH ATLANTIC/FLORIDA KEYS COMMERCIAL FISHERMEN SURVEY**  
 (Basic Questionnaire)

START TIME:  
 #444-360/61  
 June, 1994

1a. (SHOW CARD A) One of the boats selected for this survey has (VESSEL REGISTRATION NUMBER) as its Vessel Registration Number. Which one of the statements on this card best describes your position on that boat?

- Owner and captain ..... 1 (1b) 207
- Owner, but not captain..... 2 (1b)
- Captain, but not owner..... 3 (1b)
- None of the above..... 4 (T)

b. For how many years have you been an/a (POSITION CIRCLED IN Q.1a) of this boat or any other boat? # \_\_\_\_\_ years

2a. In which of the following areas did this boat fish commercially for reef fish such as snapper, grouper, sea bass, amberjack, porgy, tilefish, hog fish or trigger fish during 1993? Did it fish off ..... (READ LIST AND CIRCLE ALL THAT APPLY)

- The Carolinas ..... 1 210:218
- Georgia..... 1
- Atlantic side of Florida..... 1
- Atlantic side of the Florida Keys..... 1
- Gulf of Mexico side of the Florida Keys..... 1
- Other areas in the Gulf of Mexico..... 1
- None of the above..... 1 (T)

b. (IF "1" OR "2" CIRCLED IN Q.1 a, ASK:) How many boats do you own that are used for commercial fishing along the South Atlantic Coast, Florida Keys or in the Gulf of Mexico? # \_\_\_\_\_ boats 217:219

c. (IF 2 OR MORE IN Q.2b, ASK Q.2c FOR EACH LISTED AREA:) How many fish commercially in (AREA)?  
 # \_\_\_\_\_ South Atlantic Coast # \_\_\_\_\_ Florida Keys # \_\_\_\_\_ Gulf 220:228

3a. For how many years have you been a commercial fisherman? # \_\_\_\_\_ years 229:230

b. (SHOW CARD B) Which statements on this card describe the type of commercial fisherman you are? Select as many as apply. (CIRCLE BELOW UNDER COL.3b)

c. (IF MORE THAN ONE STATEMENT CIRCLED IN Q.3b, ASK:) How did your 1993 total gross revenue breakdown percentage-wise by these fishing activities? (RECORD BELOW UNDER COL.3c)

	(3b)	(3c)	%	
Fish commercially for reef fish along the South Atlantic Coast .....	1	_____	%	* 231,232:234
Fish commercially for other species along the South Atlantic Coast .....	1	_____		235,236:238
Fish commercially for reef fish in the Florida Keys.....	1	_____	*	239,240:242
Fish commercially for other species in the Florida Keys.....	1	_____		243,244:246
Fish commercially for reef fish in the Gulf of Mexico .....	1	_____	*	247,248:250
Fish commercially for other species in the Gulf of Mexico .....	1	_____		251,252:254
Charter/head boat operator .....	1	_____		255,256:258
Other (SPECIFY): .....	1	_____		259:261,262:264
<b>MUST ADD TO -----&gt; 100%</b>				

**\* VERIFY IF SUM TOTAL NOT AT LEAST 5%. IF LESS THAN 5%, TERMINATE AND NOTE SUCH ON SCREENER.**

4. Taking into account all the different kinds of commercial fishing you have done, what are all the ports you have worked from in the past 10 years starting with the most recent years, and the years you worked out of each one? (RECORD CITY AND STATE)

City	State	Years
_____	_____	265:267,268:269
_____	_____	270:272,273:274
_____	_____	276:277,278:279
_____	_____	280:282,283:284

5. (SHOW CARD C) Again, taking into account all the different kinds of commercial fishing you have done, which types of gear have you ever used for commercial fishing?

Bottom long lines..... 1	285:292	Spears w/power heads..... 1	293:298
Bandit reels (including electric & hydraulic)... 1		Lobster/crab traps .....	1
Surface long lines .....		Trolling lines .....	1
Hand held electric reels .....		Rod & reel..... 1	1
Sea bass traps/pots .....		Shrimp trawls..... 1	1
Other fish traps/pots .....		Other (SPECIFY):..... 1	1
Gill nets .....			
Spears fishing (w/o power heads)..... 1			307:316

- 6a. (SHOW CARD D) Which of these fish or shell fish have you ever targeted as the main or primary catch when fishing commercially? Do not include incidental catches. (CIRCLE UNDER COL.6a)
- b. (SHOW CARD E AND FOR EACH KIND CIRCLED IN COL.6a, ASK:) During which of these years was (KIND) a main or primary catch when fishing commercially? (CIRCLE UNDER COL.6b)
- c. (IF MORE THAN ONE BOAT OWNED - Q.2b, ASK:) Which of these kinds of fish or shell fish were the main or primary catch during 1993 for the boat selected for this survey? (READ KINDS CIRCLED UNDER 1993 COLUMN AND CIRCLE RESPONSES UNDER "1993 - SAMPLE BOAT ONLY.")
- d. (IF 2 OR MORE MAIN/PRIMARY CATCHES CIRCLED UNDER COL.1993 OR COL.6c, ASK:) Which main catch from the boat selected for this survey brought in the most revenue during 1993? (RECORD "1" OPPOSITE THE CATCH UNDER COL.6d) Which catch from this boat brought in the next most revenue during 1993? (RECORD BELOW "2" OPPOSITE THE CATCH. CONTINUE UNTIL ALL MAIN CATCHES OF SAMPLE BOAT DURING 1993 ARE IN RANK ORDER.)

**IF NO SPECIES CIRCLED UNDER COL.1993 OR COL.6c IN THE "OTHER KINDS" BOX IN THE Q.6 GRID ON THE NEXT PAGE, SKIP TO INSTRUCTION BOX BELOW.**

- e. You mentioned that the sample boat targeted fish other than reef fish during 1993 as a main catch. With which of these other kinds of main catches, if any, were reef fish a significant incidental catch? (CIRCLE BELOW UNDER COL.6e)  

None 0 (INSTRUCTION BOX BELOW)
- f. (IF 2 OR MORE OTHER KINDS CIRCLED UNDER COL.6e, ASK:) With which kind did the incidental reef fish catch contribute the most revenue during 1993? (RECORD "1" OPPOSITE THAT CATCH UNDER COL.6f) With which kind did the incidental reef fish catch contribute the next highest revenue during 1993? (RECORD "2" OPPOSITE THAT CATCH UNDER COL.6f. CONTINUE UNTIL ALL KINDS CIRCLED IN COL.6e ARE RANKED.)

<u>Other Kinds</u>	Circled Under Col.1993 or <u>Col.6c</u>	(6e) Had Significant Incidental Catch <u>of Reef Fish</u>	(6f) Rank Order Importance <u>By Revenue</u>

- ADMINISTER A GREEN QUESTIONNAIRE FOR EACH OF THE TWO MOST IMPORTANT CATCHES IN THE "REEF FISH" BOX FOR THE SAMPLE BOAT (Q.6d).
- IF THE 2 MOST IMPORTANT ARE NOT FISHED FOR ON SEPARATE TRIPS, COMPLETE ONE GREEN QUESTIONNAIRE FOR THE "COMBINED TRIP" AND A SECOND GREEN QUESTIONNAIRE FOR THE 3RD MOST IMPORTANT REEF FISH.
- IF ONLY ONE KIND OF REEF FISH WAS THE MAIN CATCH FOR THE SAMPLE BOAT IN 1993 (COL.6c), COMPLETE GREEN QUESTIONNAIRES FOR IT AND FOR THE CATCH LISTED IN COL.6f ABOVE HAVING THE MOST IMPORTANT (#1) INCIDENTAL CATCH OF REEF FISH.
- IF NO REEF FISH WERE A MAIN CATCH FOR THE SAMPLE BOAT IN 1993 (COL.6c), ADMINISTER GREEN QUESTIONNAIRES FOR THE CATCHES RANKED #1 AND #2 IN COL.6f ABOVE.
- IF ALL THE ABOVE INSTRUCTIONS YIELD ONLY ONE GREEN QUESTIONNAIRE, COMPLETE A SECOND GREEN QUESTIONNAIRE FOR THE MAIN CATCH IN THE "OTHER KIND BOX" MAKING THE MOST OR NEXT MOST IMPORTANT CONTRIBUTION TO REVENUE (6d).
- AFTER THE 2 GREEN QUESTIONNAIRES ARE COMPLETED, CONTINUE WITH Q.7 ON PAGE 4.

New York, NY 10016

**SOUTH ATLANTIC/FLORIDA KEYS COMMERCIAL FISHERMEN SURVEY**  
(Green Supplemental Questionnaire)

#444-360/61  
NA47FF0014  
June, 1994

Respondent: \_\_\_\_\_ Vessel Registration No.: \_\_\_\_\_  
1607:1616

1. ENTER SPECIFIC NAME(S) OF MAIN/PRIMARY CATCH FROM COL.1993 UNDER Q.6b, Q.6c OR Q.6d: \_\_\_\_\_  
1617:1628

**READ**

All of the following questions will only pertain to the boat selected for this survey and its commercial fishing trips where (KIND IN Q.1) was the main or primary catch.

2a. What was the boat's principal port in 1993 when (KIND IN Q.1) was the main or primary catch?

\_\_\_\_\_ (CITY) 1627:1628 \_\_\_\_\_ (STATE) 1629:1630

b. What was the boat's average crew size, including the captain, when (KIND IN Q.1) was the main or primary catch? # \_\_\_\_\_ 1631:1633

3a. During which months of 1993 was (KIND IN Q.1) the boat's main or primary catch? (CIRCLE BELOW UNDER COL.3a)

b. (FOR EACH MONTH CIRCLED IN Q.3a, ASK:) How many trips did the boat take for (KIND IN Q.1) during (MONTH) in 1993? (RECORD BELOW UNDER COL.3b)

c. (FOR EACH MONTH CIRCLED IN Q.3a, ASK:) How many days on average was the boat's typical trip for (KIND IN Q.1) during (MONTH)? (RECORD BELOW UNDER COL.3c) Be sure to count from the time the boat left the dock to the time of its return.

Hand held electric reels.....	1	1	Rod & reel.....	1	1
Sea bass traps/pots.....	1	1	Shrimp trawls.....	1	1
Other fish traps/pots.....	1	1	Other (SPECIFY):	1	1
Gill nets.....	1	1			
Spears fishing (w/o power heads) .....	1	1			

- 5a. RECORD BELOW ON THE FIRST LINE UNDER COL.5a/b THE MAIN CATCH FROM Q.1.
- b. (SHOW CARD D) Think of a typical commercial fishing trip during 1993 when (KIND IN Q.1) was this boat's main or primary catch. What other kinds of fish made up the usual incidental kept catch? You might want to refer to your log book or records to select a typical trip. (RECORD SPECIFIC NAMES BELOW UNDER COL.5a/b)

1742 = BLANK

- c. What was the average total poundage of fish brought to the dock and sold per trip in 1993 by this boat when (KIND IN Q.1) was the main catch and (INCIDENTAL KINDS LISTED UNDER COL.5a/b) were the incidental catch?
- \_\_\_\_\_ lbs. per trip 1743:1748

- d. (FOR EACH KIND OF FISH LISTED UNDER COL.5a/b, ASK:) How many of these pounds were (KIND)? (RECORD BELOW UNDER COL.5d)

- e. What was the average total revenue received per trip in 1993 when (KIND IN Q.1) was the main catch and (INCIDENTAL KINDS LISTED UNDER COL.5a/b) were the incidental catch landed from this boat? Do not deduct any unloading or packing fees.
- \$ \_\_\_\_\_ per trip 1748:1755

- f. (FOR EACH KIND OF FISH LISTED UNDER COL.5a/b, ASK:) What was the average price per pound you received for (KIND) in 1993? Do not deduct any unloading or packing fees. (RECORD BELOW UNDER COL.5f)

MULTIPLY VALUES IN 5d BY THOSE IN 5f AND ADD THEM UP. HAVE RESPONDENT LOOK AT TOTAL OF REVENUE COLUMN AND AMOUNT IN Q.5e. DETERMINE WHAT IS THE MOST ACCURATE AMOUNT AND ADJUST ACCORDINGLY.

- g. (FOR EACH KIND OF FISH LISTED UNDER COL.5a/b, ASK:) What percent of the (POUNDS IN 5d) of (KIND) were usually caught per trip in Federal waters? (RECORD BELOW UNDER COL.5g)

	(5a/b)	(5d)	(5f)	(5g)
	All Catches	Average Pounds Per Trip	Average Price Per Pound	Average % in Federal Waters
Main:				
	1758:1757	1758:1782	1763:1787\$	1768:1774
	1778:1779	1780:1784	1785:1788\$	1790:1796
Incidental:				
	1807:1808	1808:1813	1814:1818\$	1819:1825
	1829:1830	1831:1835	1836:1840\$	1841:1847

	1949:1950	1951:1955	1956:1960\$	1961:1967
	TOTAL ----->:	1971:1977	TOTAL ----->:\$	1978:1984

- h. Are you usually charged unloading and packing fees? Yes 1 1985  
No 2 (6a)

- i. What are the usual unloading and/or packing fees deducted from the sale of your catch? 1988:1988  
\_\_\_\_\_ cents per pound  
Don't know 0

- j. Your average total unloading and/or packing fee in this case would be (CENTS IN Q.5i) times (POUNDS IN Q.5c) for a total of .... 1989:1995  
\$ \_\_\_\_\_  
(DO CALCULATION)

- 6a. What was the usual condition of (KIND IN Q.1) landed on the dock from this boat on those trips in 1993 when (KIND IN Q.1) was the main or primary catch? 1990  
Gutted, but head on..... 1  
Whole, as caught..... 2  
Cored/plugged (no head, tail or guts)..... 3

- b. To what type of buyer do you normally sell your reef fish when you fish for **(KIND IN Q.1)**?  
 Retailer/restaurant ..... 1 1997  
 Wholesaler/processor ..... 2  
 Other (**SPECIFY**): ..... 3  
 \_\_\_\_\_ 1998:1999
- 7a. How many gallons of fuel did the boat use on average per trip during 1993 when **(KIND IN Q.1)** was the main or primary catch?  
 # \_\_\_\_\_ gallons per trip  
 2007:2011
- b. What was the boat's average fuel cost per trip in 1993 when fishing commercially for **(KIND IN Q.1)**?  
 \$ \_\_\_\_\_ per trip  
 2012:2016
- 8a. How many pounds of ice on average did the boat take on board per trip in 1993 for this kind of fishing?  
 # \_\_\_\_\_ pounds per trip  
 2017:2022
- b. What was the average cost for ice per trip in 1993?  
 \$ \_\_\_\_\_ per trip  
 2023:2029
- c. (IF "NO COST," ASK:) How do you get your ice?  
 Own an ice machine 1 2030  
 Lease an ice machine 2  
 Given to me free 3
- 9a. How many pounds of bait on average did the boat take on board per trip in 1993 for this kind of fishing?  
 # \_\_\_\_\_ pounds per trip  
 2031:2035
- b. Which kind of bait did you usually use on this boat in 1993 when fishing commercially for **(KIND IN Q.1)**?  
 Frozen squid ..... 1 2036:2038  
 Cigar minnows ..... 1  
 Other (**SPECIFY**): ..... 1  
 \_\_\_\_\_ 2039:2042
- c. What was the average cost for bait per trip in 1993?  
 \$ \_\_\_\_\_ per trip 2043:2047
- d. (IF "NO COST," ASK:) How do you get your bait? (MULTIPLE RESPONSES ARE ACCEPTABLE)  
 Fish for it ..... 1 2048  
 Given to me free ..... 2  
 Other (**SPECIFY**): ..... 3  
 \_\_\_\_\_ 2049:2050
10. On a typical trip for **(KIND IN Q.1)** there is usually some gear loss like hooks, line, swivels, bungee cords, weights and the like. What was the average cost of this type of gear loss per trip in 1993 when fishing for **(KIND IN Q.1)**? Do not include occasional major gear losses such as reels, anchors and the like.  
 \$ \_\_\_\_\_ per trip 2051:2055
11. What was the boat's average cost for food and beverages per trip for this kind of fishing?  
 \$ \_\_\_\_\_ per trip 2056:2060
- 12a. On a typical trip for **(KIND IN Q.1)** what percent, if any, of the gross revenue does the captain get? That is, a percent before any trip expenses are deducted.  
 \_\_\_\_\_% None 0 2061:2063
- b. On a typical trip for **(KIND IN Q.1)** what percent, if any, of the gross revenue does the boat get? That is, a percent before any trip expenses are deducted.  
 \_\_\_\_\_% None 0 2064:2068

- 13a. To learn how you determine captain, boat and crew shares, let's figure it out for the typical trip where (KIND IN Q.1) was the main catch and the usual revenue for the main and incidental catches was (AMOUNT IN Q.5a). (RECORD AMOUNT IN Q.5e ON LINE 1)
- b. (SHOW CARD F) What, if anything, do you deduct before determining captain, boat and crew shares? (LINES 2 THROUGH 10 UNDER (b))
- c. FOR EACH ITEM CIRCLED IN Q.12b ENTER THE AMOUNTS FROM QUESTIONS 5j, 7b, 8b, 9c, 10 AND/OR 11 ON LINES 2 THROUGH 10 UNDER (c). (FOR OTHER LISTED ITEMS, ASK:) How much was deducted for (ITEM)? (FOR CAPTAIN'S/BOAT'S SHARE OF GROSS REVENUE APPLY PERCENTS IN Q.12a/b TO AMOUNT ON LINE 1 FOR AMOUNT TO BE ENTERED ON LINES 9 & 10.)
- d. ADD AMOUNTS ON LINES 2 THROUGH 10 AND ENTER ON LINE 11.
- e. RECORD THE DIFFERENCE BETWEEN LINE 11 AND LINE 1 ON LINE 12.
- f. What is the captain's share of the net revenues after deductions? (ENTER THE AMOUNT ON LINE 13)
- g. What is the boat's share of the net revenues after deductions? (ENTER THE AMOUNT ON LINE 14)
- h. What is the crew's share? (ENTER THE AMOUNT ON LINE 15)

**WORKSHEET FOR Q.13**

Line					
1	(a.) Typical <u>revenue</u> from Q.5			\$ _____	2067:2071
