RADIOACTIVITY IN FOODS

The amount of radioactivity now being found in food does not warrant any action by the Government, or any change in buying or food preparation habits of the United States consumer. If the situation should change, the public and appropriate public health officials at all levels of Government will be kept informed. Channels of communication already exist to assure that this is done.

Should protective measures ever have to be considered, the amount of radioactivity in the total diet, as consumed, could be substantially reduced by simple and ordinary sanitary precautions such as washing and peeling, and by proper care in the use of foods which are protected from fallout by tight, impenetrable packaging. (FDA Memo for Consumers, April 16, 1962, U. S. Food and Drug Administration.)
